INFO90009_2026_SM2 User Experience Design Project

Day One
Usability Evaluation Report

Student Name: Yue Wang 1118786, Yao Chen 1118937

Submission date:25/10/2026

Executive Summary

This is a usability evaluation report of the high-fidelity prototype of Day One, a mobile application designed to support international students to better settle into everyday life in Melbourne. Six international students participated in usability testing sessions lasting approximately 30–35 minutes, with three sessions conducted online and three conducted in person. User feedback was collected through usability testing, guided prototype walkthroughs, and semi-structured interviews. The collected data was analysed using thematic analysis and Nielsen's usability heuristics (Nielsen, 1994a) to further identify and analyse usability problems.

Overall, participants found Day One useful in real-life situations, but several usability problems were identified. The Short Trip feature lacks flexibility in route planning, and its purpose is not clearly distinguished from regular navigation applications. Journey Tree has high information density and limited flexibility in accessing specific steps and information. AR Lens requires too many interaction steps, making it less efficient in situations where users need immediate support. Ask This Place sometimes provides location-based recommendations that do not match users' actual needs. In addition, the lack of integration between different features increases the effort required for users to switch between features.

To address these problems, this report recommends adding more flexibility to route planning, improving information organisation, simplifying interaction processes, and adding the integration between different features. The team also decided to remove the gamification rewards and focus more on the core features that help users explore their surroundings.

This study had several limitations, including the small sample size and some incomplete prototype features that required additional explanations and assistance during testing. In the future, the design will be further improved based on the evaluation findings. These improvements aim to make Day One easier and more efficient to use in real-world situations, helping international students better adapt to local life.

1. Introduction

For international students who have just arrived in Australia, settling into a new environment could be difficult. They have to individually learn about local rules and how to use this information in real situations. For example, taking public transport, booking a doctor's appointment, and exploring

nearby places. How might we help international students find useful information, understand everyday situations, and feel more confident exploring Melbourne? To address this question, we designed Day One. It is an app that helps international students better settle into local life in Melbourne. It has three main features. Short Trip helps users explore nearby places. Journey Tree helps users learn how to complete daily tasks. Tools provide useful local information through AR Lens and Ask This Place. This study mainly focuses on testing the usability of the Day One high-fidelity prototype. We wanted to understand whether users could understand the interface, use the features, and find them helpful.

2. Method

This study consists of usability testing and semi-structured interviews to evaluate the interface usability, feature understanding, and perceived usefulness of the Day One high-fidelity Figma prototype. Since different features have different levels of completeness, the testing consists of guided walkthroughs, interactive prototype testing, and feature demonstrations. Six participants (P1–P6) were recruited through personal connections and the social media platform Xiaohongshu. All participants were international students who have studied or are planning to study overseas with different lengths of living in Melbourne. Three testing sessions were conducted online via Zoom, while the other three were conducted in person. All participants interacted with the high-fidelity Figma prototype. During online sessions, participants shared their screens through Zoom, while researchers observed participants' interactions directly during in-person sessions. Researchers recorded participants' actions and feedback during the sessions. Since the prototype did not include complete backend functions, some features required demonstrations and explanations. Each interview session had a duration of 30-35 minutes. Participants were encouraged to speak aloud their interaction and understanding. All testing sessions were recorded with participants' consent and transcribed for further analysis. These data were analysed using thematic analysis and were categorised and organised based on different features. This study also used Nielsen's 10 Usability Heuristics (Nielsen, 1994a) to identify usability issues and Nielsen's Severity Ratings (Nielsen, 1994b) to evaluate each problem based on its frequency, impact, and persistence.

Limitations

The limitation of this method is that the sample size was relatively small, which might not accurately identify all issues. Some features required explanations from researchers, which may impact how participants interpret different features. Furthermore, since the testing mainly focused on interface

understanding and perceived usefulness, task completion rates, error rates, and satisfaction scores were not collected.

3. Test Result

Explore (Short trip)

Finding 1 Clear workflow but unclear exploration value

During the evaluation, participants generally understand how to plan a route using Short Trip. However, some participants first thought it was just a normal wayfinding tool. They did not realise that it could help new students explore their local area. For example, P5 compared it with Google Maps. Other participants thought the recommended places were only for buying coffee or shopping. After the researchers explained the purpose of Short Trip, participants became more positive. P3 said, “This is very useful for new students. It can help them learn more about their local community.” P6 also felt that this feature could help them explore new places and learn more about the surrounding area. These findings show that participants saw the value of Short Trip for exploring new places. However, the current interface does not clearly show how it is different from normal navigation apps.

Finding 2 Need for Personalised Route Planning

Limited route customisation was the most common problem in the Short Trip testing. 4/6 participants wanted to choose or change the Checkpoints themselves. They wanted to plan routes based on their interests, available time, and destination, instead of only using the recommended Checkpoints. For example, P4 said, “I want to see nearby places on the map, such as Queen Victoria Market, cafes, and dessert shops. Then I can choose where I want to go.” P6 also wanted to choose Checkpoints based on how much time they had. These findings show that participants liked the recommended places. However, they also wanted more control over their routes and Checkpoints.

Finding 3 Information Layout and Interaction Issues Affect Usability

The testing showed that participants could generally understand the route preview and navigation process. However, some interface designs still caused problems.P5 felt that the map markers and the place cards at the bottom showed repeated information. This made the interface look crowded. They suggested showing simple place information directly on the map. Also, P5 could not find the Start Journey button and needed help from the researcher to continue. P2 and P5 also did not understand what XP and Level meant. P2 was not sure how XP was calculated for different places. These findings

show that some information and instructions in the interface were not clear enough. Users may need more time to understand and use these features.

Finding 4 different participants have various opinions on gamified award features.

The testing showed that some participants liked gamification features such as XP, Level, and badges. They felt these features could make exploring new places more interesting. P2 said, “I think it would be helpful if these points could be turned into badges or used to unlock achievements.” However, different users had different interests in these rewards. P3 felt that these rewards might be more useful for new students in Melbourne because they need to learn about their local area. For users who already know the area well, these rewards might be less interesting. These findings show that gamification can encourage users to explore new places. However, its value may depend on how familiar users are with the local area and their personal needs.

Journey Tree

Finding 5 High information density increases the burden of reading and searching

Five participants (P1, P3, P4, P5, P6) suggested that the information is dense and heavy in the Journey feature, especially the Healthcare part. P1 pointed out that every step of the Healthcare journey includes text-heavy introductions and descriptions that lack subheadings to efficiently summarize the content, making it difficult to quickly locate and jump to a specific step when they want to review it. P5 found that while the information in the Healthcare journey is comprehensive and complete, the mobile interface lacked clear visual focal points, resulting in a high cognitive load.

Finding 6 The linear flow limits users’ ability to access specific steps as needed

The current Journey tree feature is designed as a sequence of consecutive steps. Some participants found this structure less flexible and noted that it did not meet their information-seeking habits in real-life situations. P2 suggested that this current structure did not allow them to quickly jump to a certain step if they only wanted to view information about that specific step. They also pointed out that users may only need to view information for a specific stage and do not necessarily need to complete the entire learning process. On the other hand, P4 and P6 suggested that they preferred to understand the overall process first before going into details.

Finding 7 Access to scenario simulation lacks flexibility

Scenario simulation is a feature placed at the end of the Journey learning process that is designed to help students practice and understand how to interact in a simulated scenario. Our participants found it

very useful, but noted that it lacks flexibility. P2 would prefer to be able to access this feature at any time without needing to complete the entire learning process. P6, on the other hand, argued that users who are not yet familiar with the process (in this case, the healthcare process) may find it difficult to complete the scenario simulation. However, they also suggested that users who have already completed the learning process should be able to access the scenario simulation directly.

Tools - AR Lens & Ask This Place

Finding 8 AR Lens is difficult to adapt to scenarios requiring quick action

Both P1 and P2 pointed out that AR Lens may not be efficient and convenient enough in certain situations, such as a scenario where a user is getting on a tram and wants to know how the Tap-on machine works. P1 said that accessing useful information using AR Lens requires users to enter the Tools page, click the AR Lens feature, scan the device, and then tap “Details” to finally view useful instructions. Users may not have enough time to complete these multiple steps while actually getting on a tram. P6 further suggested that holding a phone up continuously to scan a device in these scenarios may appear unnatural and awkward in a public space.

Finding 9 Scanning Results do not immediately provide the operational information users need most

In the scenario when participants scan the Myki Reader, some of them wanted the scan results to more directly address practical questions. P2 pointed out that simply identifying the device and providing a basic description was not enough for them to understand how to use it. They would prefer to know information such as whether they had to tap their card, which type of card to use, or what payment method to select. P4 also argued that scanning devices will only show the name of the device; obtaining the description requires an extra step, which is less intuitive and has a high interaction cost. P3 suggested that a brief introduction combined with expandable detail content was generally sufficient.

Finding 10 Location Recommendation from Ask This Place may not align with users’ actual intention

Ask This Place automatically provides useful information and recommendations according to the user's location. P5 argued that simply being at a certain location does not necessarily mean a user needs the services associated with that location. For example, a user might just be passing by Queen Victoria Market to use the tram. In this case, information suggested by the feature may not necessarily meet the user's current needs. P6 further noted that in a situation where multiple stores or service facilities are located in close proximity to one another, the automatically generated information

according to the location may present unwanted information about a proximate facility. Participants wanted to be able to actively select or change the current location, or tailor how information is recommended when two or more locations overlap, but the existing prototype only displayed the automatically identified location without providing a clear way to switch it.

Finding 11 The connection between tools and other features is not direct enough, increasing the cost of switching

Both P1 and P2 suggested that some Tools features are closely related to features on other pages but require access through a separate entry point. P1 said that during the Explore navigation session, users will go through an exhausting process if they want more recommendations or encounter unfamiliar facilities, as they must exit the current screen, enter Tools, enter the Ask This Place feature, gather information, and then return to the original page. P2 also pointed out that content introduced in the Healthcare Journey, such as finding a GP, making appointments, and preparing for a visit, is potentially relevant to information provided by Ask This Place if users are currently in a clinic. However, accessing this information currently requires users to open separate features individually.

4. Discussion and Problem Analysis

4.1 Limited Route Customisation

Severity: High

Limited route customisation was the most serious problem in this test. 4/6 participants wanted to change their routes. This problem mainly appeared on the Short Trip route planning page. Currently, the system only provides fixed recommended routes. Users cannot freely add, remove, or change Checkpoints. This makes it difficult for users to plan routes based on their own needs. At the same time, this problem is related to Nielsen's User Control and Freedom principle. Users want to choose routes based on their available time, destination, and interests. However, fixed routes limit their choices. As a result, the lack of customisation may cause users to take unnecessary routes. It also makes Short Trip less useful in daily life. Users may choose other navigation apps instead.

4.2 Unclear Feature Purpose

Severity: High

The purpose of Short Trip was not clearly shown on the first screen. This problem mainly appeared at the Short Trip entry point on the Explore page. The testing showed that some participants understood

how to plan a route. However, they first thought Short Trip was just a normal navigation tool or a feature for recommending shops along the way. They did not realise that it was designed to help international students explore and learn about their local area. This problem is related to Nielsen's Match Between System and the Real World principle. The current interface mainly shows routes and destinations. It does not clearly explain how the feature helps users explore new places. After the researchers explained the purpose, several participants felt that the feature was useful. This shows that users did not dislike the feature. They just did not understand its main purpose. As a result, the lack of a clear introduction may affect users' first impressions. It may also make them less interested in using Short Trip.

4.3 Interface Clarity and Discoverability

Severity: Medium

Some information layouts and buttons were not clear enough. This affected the user experience. This problem mainly appeared on the Explore map and Route Preview pages. During the testing, P5 felt that the map and the place cards at the bottom showed repeated information. This made the interface look crowded. Also, P5 could not find the Start Journey button during the route preview and needed help from the researcher to continue. This problem is related to Nielsen's Recognition Rather Than Recall principle. Important buttons and actions should be easy for users to find. Users should not need extra guidance. Repeated information may make the interface harder to understand. Buttons that are difficult to find may also make tasks take longer. However, this test used a web prototype. The experience may be different on a real mobile phone. Therefore, more testing on real mobile devices is needed.

4.4 Unclear Gamification Feedback

Severity: Medium

Unclear gamification reward rules were another problem found in this test. 2/6 participants did not understand what XP or Level meant. This problem mainly appeared in the XP, Level, and Badge features on the Explore page. Some participants felt that rewards could make exploring more fun. However, they did not understand how XP was calculated or what Level meant. This problem is related to Nielsen's Visibility of System Status principle. The system should clearly show users how their exploration activities affect XP, Level, and rewards. If the reward rules are not clear, users may not understand the connection between exploring and earning rewards. This may also make the gamification features less interesting.

4.5 Limited Flexibility in Information Access

Severity: Medium

The Journey Tree lacks flexibility in terms of information access and has high information density. Five out of six participants mentioned the issues that information is very dense to navigate. Furthermore, P2 pointed out that the sequential structure made it difficult to access specific steps directly, while P4 and P6 preferred to understand the overall process before viewing detailed information. The current learning process of Journey is sequential, with each step containing a large amount of text and the scenario simulation at the end, making it difficult for users to quickly access information based on their needs. This relates to Nielsen's Flexibility and Efficiency of Use, as different users may wish to complete the learning process, review a specific step individually, or proceed directly to the scenario simulation. This fixed learning process may increase unnecessary reading and operational costs, making it less practical as a quick reference tool to help users understand local procedures.

4.6 Inefficient Access to Time-Sensitive Information

Severity: Medium

The AR Lens has some operational issues that impact its efficiency, especially in scenarios that require immediate support. P1 and P2 pointed out that accessing useful information through AR Lens requires too many steps, while P6 noted that holding a phone up to scan devices in public may feel awkward. Furthermore, P2 and P4 suggested that scan results should directly provide practical instructions rather than requiring additional interactions. This problem is mainly caused by the overall design of AR Lens interface including its entry page and scan result page. Users must go through multiple steps to enter the AR lens interface and the feature requires them to tap extra to view details of scanned devices. The description provided by scanning also did not prioritize practical operation information that participants valued the most. This relates to Nielsen's Match Between the System and the Real World principle, as users in scenarios such as getting on a tram need immediate support on how to proceed rather than holding a phone and reading a complete device introduction. Therefore, even if the scan result is accurate, this lengthy operation process may cause users to miss the crucial moment to obtain useful support.

4.7 Limited User Control over Location Based Recommendations

Severity: Medium

Ask This Place relies heavily on user locations, which may result in recommendations that do not meet the user's actual needs. Two out of six participants explicitly mentioned this issue. The current feature provides quick recommendations and shortcut keyword based on current location, but users

cannot easily modify the locations identified by the system, which might provide unwanted recommendations due to inaccurate GPS location or overlapping between two places. This relates to the User Control and Freedom principle, as users should be able to freely adjust the location to allow the system to generate more accurate recommendations. Furthermore, when multiple facilities or venues are adjacent or users need information that is unrelated to their current location, recommendations may lose its value, increasing the effort for users to find the right help.

4.8 Fragmented Feature Integration

Severity: Medium

Two out of six participants mentioned that the current prototype lacks integration between different features, making it difficult and cumbersome to access different features without interrupting current flow. Currently, Journey Tree, Explore, and Tools (Ask this place and AR Lens) function separately, requiring users to leave the current page to access other related features. For instance, if a user needs help finding a recommendation about a location while using the Explore feature (when they are on a short trip), they must exit the page to obtain recommendations using other relevant features and start the exploration over again. This relates to Nielsen's Flexibility and Efficient of Use principle, as our features should support users in efficiently completing real-world tasks. Therefore, the lack of cross-feature access and integration may reduce the app's efficiency in real-world scenarios.

5 Recommendation

5.1 Support Customisable Routes

To solve the problem of limited route customisation, adding a custom route feature should be a priority. Short Trip should allow users to add, remove, or replace Checkpoints directly on the map. Users can change their routes based on their interests, available time, distance, and transport options. The system should also keep the automatic route recommendations. However, recommended places should be optional, not required stops. This can help users explore new places while giving them more freedom to plan their routes. It can also make Short Trip more useful for users with different travel needs.

5.2 Clarify the Purpose of Short Trip

To solve the problem of the unclear purpose, improving the Short Trip entry page should be a priority. This can help users understand the feature when they first use it. The current interface mainly uses

buttons such as Plan Trip and Start. It does not clearly explain how Short Trip is different from normal navigation apps. Therefore, a simple description such as “Explore new places on your way” could be added. This can help users understand that the feature allows them to discover new places and learn about local life during their daily trips. Each recommended place should also have a short introduction. For example, it could explain the place's cultural background, daily uses, or why it is useful for new students to explore. These changes can help users understand the value of Short Trip more quickly. They can also reduce the need for extra explanations from researchers.

5.3 Improve Information Hierarchy and Navigation

To solve the problem of the unclear interface, the map layout and main buttons should be improved. The priority of this improvement is Medium. Currently, the map and the place cards at the bottom show some repeated information. Users could tap on map markers to see short descriptions of places. More details should only appear when users need them. This can make the interface cleaner. Also, important buttons such as Start Journey should be placed in easy-to-find positions. Swipeable panels should have clear hints so users know they can swipe. These changes can help users understand the interface more easily, reduce unnecessary actions, and make the route planning process smoother.

5.4 Remove Gamification to Prioritise Exploration

To address the unclear gamification feedback, we recommend removing the XP, Level, and Badge features from Short Trip. The priority of this improvement is Low. The testing showed that some participants did not understand how the reward system worked. Besides, different users had different levels of interest in these features. Therefore, we decided to remove the gamification features and focus on the main purpose of Short Trip, which is helping users explore new places and learn about their local area. This change can simplify the interface and reduce unnecessary information. It also allows users to focus more on route planning and exploring places without being distracted by rewards.

5.5 Improve Information Accessibility In Journey Tree

To address the information organisation and access issues identified in Section 4.5, we recommend redesigning Journey Tree around a card-based Overview page. This new Overview structure should aim to allow users to understand the process with a glance, and also allow flexibility. Each step of a journey should be presented as an individual card containing a title and a brief introduction, allowing users to quickly understand the overall process and freely select specific steps to view detailed information without following a fixed learning sequence. Furthermore, shortcut to other features such as Scenario Simulation should be added in an appropriate page, allowing users to access the practice

directly based on their needs. This improvement would support both complete process learning and quick information access, reducing unnecessary reading and interaction costs.

5.6 Simplify AR Lens Interaction

To address the inefficient operation of AR Lens, we recommend simplifying the interaction process from accessing the feature to obtaining practical support. Users should be able to open AR Lens directly from the Home page and immediately start scanning. Once a device is successfully scanned, relevant information should automatically appear without requiring users to tap an additional Details button. Furthermore, the scan results should prioritise practical instructions through brief text and visual guidance. For example, after identifying a Myki Reader, the feature should directly explain how to tap on and provide relevant information, such as ticket price. This improvement would reduce unnecessary interaction steps, allowing users to obtain timely support in situations that require quick action.

5.7 Improve User Control in Ask This Place

To address the issue where Ask This Place may not meet users' actual needs, we recommend providing clearer location information and allowing users to manually adjust the automatically identified location. The interface should display the name and image of the currently identified place, enabling users to quickly confirm whether the system has identified the correct location or the one they are interested in. Furthermore, users should be able to manually change the selected location or choose other nearby places instead of relying entirely on automatic location identification. This improvement would reduce irrelevant recommendations caused by inaccurate GPS locations or multiple nearby points of interest, giving users better control over location-based information and making recommendations more relevant to their actual needs.

5.8 Improve Integration Between Features

To address the lack of integration between different features and the low efficiency of the interaction flow, we recommend integrating frequently used tools into main interaction flows. First, AR Lens, Ask This Place, and Scenario Simulation should be moved to the Homepage to reduce the steps required to access these features. Moreover, during a Short Trip in Explore, users should be able to access Ask This Place directly to get relevant support without leaving the current journey. Furthermore, recommendations provided by Ask This Place should be able to integrate with Explore, allowing the system to generate Short Trips based on recommendations in Ask This Place, so that users can naturally move from information searching to real-world exploration. This improvement

would reduce unnecessary interface switching and allow different features to better support continuous interactions.

6. Conclusion

In conclusion, this test helped us understand the user experience of Day One. Overall, participants found the app useful, but several problems were identified. For Explore (Short Trip), users wanted more control over routes and a clearer understanding of its purpose. Journey Tree had high information density and limited flexibility in accessing specific content. AR Lens required too many steps to access practical information, while Ask This Place sometimes provided recommendations that did not match users' needs. The limited integration between features also made interactions less efficient. We suggest adding custom routes, simplifying information, reducing steps, and improving connections between features. We also decided to remove gamification rewards to focus more on the core functionality of Day One. This study had limitations, including only six participants and some unfinished features that required researchers' help. In the future, we will improve the design and test it again on real mobile devices. Our goal is to make Day One more accessible, efficient, and useful in helping international students navigate unfamiliar situations and adapt to local life.

Appendix

Interview Tasks

Day One — Semi-Structured User Testing Questions

(Original source is Chinese, translated to English)

Total Duration: 30–35 minutes
Format: Background Interview + Guided Prototype Walkthrough + Simple Interaction Tasks + Open-Ended Follow-up Questions

Part 1: Introduction and Background Questions | 5 Minutes

Introduction | Approximately 1 Minute

“Thank you for participating in today's testing session. Day One is an app concept designed to help newcomers to Melbourne become familiar with local everyday life. Today, we will show you a short exploration trip, a healthcare learning journey, and two tools designed to provide assistance in real-world situations.

Please note that this is not yet a fully functional app. Some elements are interactive, while others may require us to switch between screens or provide explanations. We mainly want to understand whether these screens are clear to you and whether you find these features helpful.

We are testing the design, not your abilities. Feel free to point out anything that is unclear, unnecessary, or different from what you expected.”

If audio or screen recording is required, confirm the participant's consent before beginning.

Background Questions | Approximately 4 Minutes

1. How long have you been in Melbourne? How familiar are you with everyday life here?
2. When you first arrived, or more recently, what was the last unfamiliar everyday process you encountered? How did you deal with it?
    - If the answer is too general, provide examples such as public transport, finding places, or seeing a doctor.
3. What tools do you usually use to find directions or information about local services? Is there anything these tools have not been able to help you with?
4. Have you ever visited a GP or booked a medical appointment in Australia?
    - If yes: Which part of the process was the least clear to you?
    - If no: If you needed to make an appointment now, would you know where to start?

Moderator Notes: There is no need to ask about specific medical conditions or personal health information. Move on to prototype testing at the 5-minute mark.

Part 2: Map Trip Feature | 8 Minutes

Scenario Introduction

“Imagine you have just arrived in Melbourne and are planning to visit the University of Melbourne. You're not in a hurry today, and you'd also like to explore some nearby places along the way. Let's see how this app might help you.”

Demonstration Sequence

Map Home Screen → Destination / Trip Setup → Route Preview → During-Trip Screen → Completion Screen

1. Home Screen and Route Setup | Approximately 2 Minutes

First, allow the participant to examine the home screen.

- “If you wanted to plan this trip, where would you start?”
- “When you see this Trip feature, what would you expect it to offer?”

Allow the participant to interact with the prototype where possible. If they cannot proceed, the moderator should display the next screen.

2. Route Preview | Approximately 2 Minutes

- “What do you think this route will take you to do?”
- “Is this information enough for you to decide whether to start the trip? Is anything missing?”

Optional Follow-up Questions:

- “Do you think these places along the route are required stops, or can you choose which ones to visit?”
- “Compared with simply looking up directions to the university, in what situations would you choose to use this feature?”

3. Completion Feedback and Feature Evaluation | Approximately 2 Minutes

The moderator explains:

“Now, imagine you have completed this route.”

- “What does this screen tell you about what you have completed and what you have gained?”
- “Thinking about your everyday life, in what situations would you use this type of Trip? When would you not use it?”

Optional Follow-up Questions:

- “Would these rewards influence whether you use the feature? Why or why not?”
- “Which part of this process needs the most clarification?”

Key Observation Points

Whether the purpose of the route is clear; the difference between exploring places along the route and ordinary navigation; whether sufficient information is provided; whether the trip status is easy to understand; and whether participants can identify specific situations in which they would use the feature.

Part 3: Hospital / Healthcare Journey — Full Flow | 10–12 Minutes

1. Scenario and Task Instructions | Approximately 1 Minute

Moderator reads:

“Imagine you have just arrived in Melbourne and need to arrange a routine, non-emergency medical consultation, but you're not yet familiar with the local healthcare process.

Please use the Hospital Journey in this app, starting from the beginning and going through the entire journey, to understand what you need to do at each stage.

You can interact with the app based on your own understanding, reading and making choices as you normally would. Feel free to share your thoughts or questions at any point. We will discuss your experience together after you finish.”

2. Participant Completes the Full Flow | Approximately 6–7 Minutes

Starting from the Journey entry point, allow the participant to independently enter and complete all steps of the Hospital Journey.

The moderator should not interrupt with interview questions on every screen or explain the navigation path in advance. Participants may naturally express their thoughts but are not required to explain every action.

If the participant encounters difficulties:

- If they pause briefly, allow time for reading and thinking.
- If they actively ask for help or remain unable to proceed, first ask: “What are you trying to do right now?”
- If necessary, provide a brief explanation or assistance, and record where and what assistance was provided.
- If a prototype malfunction occurs, explain the situation and help the participant continue.

Key Observations and Notes

- Whether the participant can find the entry point and start the journey.
- Which screens they read carefully and which they skip quickly.
- Which choices or terms cause hesitation.
- Whether they notice the Continue button, and whether they navigate back or repeat actions.
- Whether they understand the current step, their progress, and the completion state.
- Where moderator assistance is required.

Record the specific screens and behaviours for follow-up discussion after the participant completes the experience.

Completing the full experience means going through the healthcare learning flow within the prototype; it does not mean making an actual medical appointment.

3. Post-Experience Interview | Approximately 3–4 Minutes

Ask the following questions in order.

1. Overall Understanding

“After completing this Journey, what do you think it has helped you accomplish? If you needed to see a doctor in real life, what would you do next?”

2. Flow and Interface Clarity

“Was there any step during the process where you were unsure what to do, or didn't understand why that step was necessary?”

If a significant difficulty was observed, return to the relevant screen and ask:

“I noticed you paused or went back at this point. What were you thinking at that moment?”

3. Information Sufficiency

“Which parts of the content helped you understand the healthcare process? Was any information missing, or was there too much information?”

4. Practical Usefulness

“If you were seeing a doctor in Melbourne for the first time, would you use this Journey? When would you open it, and why?”

Additional Question (If Time Allows):

“If you could change only one thing about this process, what would you most like to change?”

Evaluation Focus

Based on both observed interactions and interview responses, assess whether participants can successfully complete the entire flow, understand each step, and identify what they should do next in a real-life situation.

Distinguish between independent completion and completion with assistance, while also recording specific user needs and potential use cases.

Part 4: Tools Feature Demonstration | 5–6 Minutes

A. AR Lens | Approximately 3 Minutes

Scenario Introduction

“Imagine you're on a tram and notice an unfamiliar card reader. You want to know what it is and how to use it.”

Show the Tools entry point, scanning screen, and recognition details. First, allow the participant to observe and explore the interface independently.

Core Questions

- “Based on these screens, how do you think this feature works?”
- “Does the information shown after recognition answer what you would most want to know in this situation?”
- “In what situations would you use this feature? Is there another way you would normally deal with this situation?”

Optional Follow-up Questions:

- “What information would you want to see immediately, and what could be placed in the detailed view?”
- “If the system recognised something incorrectly, or you were unsure whether the recognition was correct, how would you want to handle it?”

Moderator Notes: Do not evaluate recognition speed, recognition accuracy, or the actual AR experience. Focus only on understanding of the concept, interface information, and user needs.

B. Ask This Place | Approximately 2–3 Minutes

Scenario Introduction

“Now imagine you've arrived at a clinic and need to know how to explain the reason for your visit to the receptionist, or you want to ask a question related to this place.”

Show the Ask This Place screen. If response or practice screens are available, continue to demonstrate them.

Core Questions

- “In this situation, where on the screen would you start?”
- “Do you understand what this interface is designed to do?”
- “Do any of these predefined options match what you need? If not, how would you prefer to ask your question?”
- “How do you think this differs from searching for information yourself or using a general-purpose chat tool?”

Optional Follow-up Questions:

- “How does the location information displayed on the screen affect your understanding of this feature?”
- “If you were going to act on the information it provides, what additional information would you want to see?”

Moderator Notes: If no response screen is available, discuss only the entry point, question options, and expected purpose of the feature. Do not ask participants to evaluate the quality of responses they have not seen.

Key Observation Points

Whether the purposes of the two tools are easy to understand; whether participants can identify clear use cases; what outputs they expect; and whether location-related information is helpful.

Part 5: Conclusion | 2 Minutes

1. “Of all the features we showed you today, which one best meets your needs? Can you give an example of a real-life situation where you might use it?”
2. “Which feature would you be unlikely to use? Why?”
3. “If we could improve only one thing in the next version, what do you think we should prioritise?”

Closing Statement

“Thank you. Your feedback will help us decide which areas to prioritise for improvement. Is there anything we haven't asked about today that you think is important to add?”

DAY ONE — COMBINED ENGLISH INTERVIEW SCRIPTS (P1–P6)

P1 — English Translation

Speaker 1 00:01:58
All right, I need to explain this screen. It is more of a test screen. We have not implemented its actual functionality, because that would involve integrating AI and other components. Let me briefly explain it.
This feature gives you a general scenario and some language practice. For example, in this scenario, you have just arrived [the destination is unclear in the source]. It asks you some questions. You click the button below and answer aloud. After you finish, it gives you a few tips.
That is roughly the end of the process. First, based on this walkthrough, could you comment on whether the interface and information are clear? Is there too much text, or are there any other issues? Is any of the wording difficult to understand?

Speaker 2 00:03:06
The interface itself is quite clear, although there is a bit too much text. It breaks down the whole process and gives instructions for each stage, almost like a manual. [Brief unrelated or unclear interjection.] I mean these numbered steps, one through six.
There is nothing wrong with that in itself. But each paragraph is rather long, so even after reading through everything once, I might forget something when actually doing it.
For steps one through six, it would help to have a short heading for each, such as making an appointment, attending the consultation, or medication and advice.
Because there is so much text, I would like short headings or main headings that summarise each section. During the actual process, if I forget what comes next or have a question about a previous step, I could go back and check more easily.

Speaker 1 00:04:47
Okay. Aside from that, what about the scenario afterwards, as I just described? Would this kind of simple language practice be helpful?

Speaker 2 00:05:05
This seems to be an AI interface, but mainly—

Speaker 1 00:05:12
Yes, it has not actually been implemented. I can only describe what the usage scenario would be like.

Speaker 2 00:05:19

I see. If AI could simulate the interaction, that would be helpful. It could prevent inaccurate wording on my part and reduce the time spent during an actual consultation.
It would depend heavily on how capable and accurate the AI is. But I think having an opportunity to practise would be useful.

Speaker 1 00:05:58
Okay. Now a question about your overall understanding. After going through the whole process, what do you think this Journey helped you accomplish? If you needed to see a doctor in real life, would the process now be clearer to you?

Speaker 3 00:06:16
League of Legends.

Speaker 2 00:06:19
I certainly understand a lot more than when I knew nothing about it.

Speaker 1 00:06:24
Keep robbing the bank, then. [Apparently unrelated remark.] Okay, do you think it has practical value? If you were seeing a doctor in Melbourne for the first time and did not know what to do, would you use this feature to learn about it beforehand?

Speaker 2 00:06:43
In practice, if I were already feeling unwell, I would probably prefer to ask someone or ask AI directly, because that would take less effort.
But if I were preparing to come to Melbourne, or had just arrived and was not ill, I would be happy to read it, like reading a booklet, to learn the relevant information in advance.

Speaker 1 00:07:28
Okay. Compared with this feature, what advantages does a general large language model have? And setting large language models aside, what advantages does this feature have? Could you compare the two?

Speaker 2 00:07:45
First, a large language model has the advantage of immediacy. Whatever I ask, it can answer quickly. If I ask for the entire process, GPT could probably give me that too. AI is a bit like a real customer service agent, although its answers are not always accurate.

Speaker 4 00:08:16
Me too, me too. [Fragmentary background speech.]

Speaker 2 00:08:20
If I run into a specific problem at any stage, I can ask AI and have it help me plan. I could even describe my symptoms beforehand and ask it to draft what I should say to the doctor. Those are AI's advantages.
The app's advantage is that it may be more specialised and authoritative, because AI sometimes hallucinates.
The information I look up in this app should be more factual and accurate. The contact details it provides may also be more current, real, and usable.

Because it contains a lot of information, if I have time to study the standard healthcare process in advance, the app might make it easier to obtain a complete picture. It can help me prepare for different situations, different specialties, and different doctors.
That is its advantage. It is like the difference between a printed manual and an AI assistant. AI is more immediate and personalised, while a manual can be more comprehensive and perhaps more complete.

Speaker 1 00:10:22
And more accurate. Okay, now we will move to the next stage, where I will introduce the final feature.
Please return to the main screen and open Tools. This feature also requires a lot of backend functionality, which we have not developed.
Since we only have the frontend, I cannot demonstrate everything directly, so some of it will depend on my explanation.
First, looking at this screen, what do you understand it to be? Have a look. What do you think it is, and what can it help you do? We have about ten minutes left.

Speaker 2 00:11:24
First, the top row is—

Speaker 1 00:11:28
AR. Yes, just describe whether you understand what each section does. You do not need to guess exactly how it works; I will demonstrate the intended functions. I am asking about the clarity of the screen as a whole.

Speaker 2 00:11:52
I understand what each section is intended to do, but—

Speaker 1 00:11:56
You are not yet sure how it works. Okay, please click the first feature, AR recognition. I will quickly explain it because we do not have a functioning version.
Normally, you would open your phone's camera and scan something. If the camera captures a sign or facility you do not recognise, the app tells you what it is and gives you a detailed description.
For example, here you are pointing at a tram card reader. At first, you might not know how to use it or what you need. When you point the camera at it, a small button or tag appears. You can tap Details.
It would then tell you, for example, whether you are in the Free Tram Zone, what it costs if you are outside the free zone, and some other basic information. There would also be a short video explaining it.
Those elements have not been implemented here. That is roughly how the AR feature would work. We are showing just one possible use.
Okay, please return to the previous screen. Now I will introduce the second feature, Ask This Place.
The idea is that, based on your current location, it automatically suggests relevant options. It is essentially built-in AI. Tap the AI Guide button to enter this screen, where you see some quick-access buttons.
It detects that you are at this location and automatically recommends things you may need.
For example, if you are in a hospital, it might show Talk to Reception, to help you work out what to say. Tapping it would tell you how to communicate with the staff.

If you receive a referral and the app detects that you are near the hospital, it could show a shortcut explaining what you need to do. Below that are common student queries, such as “Do I pay upfront with OSHC?”
It also offers tips about questions other students often ask. Essentially, this is a small built-in AI feature with many shortcuts tailored to your address and location.
Okay, please go back again. I want to introduce all the features on the main screen.
Below are some Quick Tools. The first is Translate Signs. If you do not know what a sign means in English or Chinese, you can take a photo to find out. It is similar to the AR feature and easy to understand.
Free Trip Check lets you quickly check whether your current location is inside the Free Tram Zone and whether you can travel for free.
There is also Health Support Contacts, which helps you contact nearby clinics or access emergency phone numbers. In an emergency, of course, our first recommendation would be to call an ambulance directly. If you need other related information, you could use this button.
Below that is Recent Scans, where you can view your history and see which features you have recently used.
That is the full introduction. First, do you think these features are useful? Which ones seem useful or less useful? Let us start with your overall view.

Speaker 2 00:16:09
I think the features themselves are practical. If the information is factual and accurate, they would certainly help international students who have just arrived in another country.
AR and the recommendations based on your current location would depend heavily on how accurately the app recognises things.
If AR recognition is inaccurate, it may not help much. But assuming recognition and location detection are accurate, I think it could be very helpful.

Speaker 1 00:17:04
Okay, now could you comment on the page design? Is the overall screen clear to you, including the smaller screens we opened?

Speaker 2 00:17:21
The sections are well separated, and the page is fairly simple. If these features could be integrated into the earlier map screen or the journey-in-progress screen, that might also work.
For example, the first two features could be placed on the home screen. Assuming they work accurately, people might use them frequently, so they could appear directly on the home screen.
You could show AR or the current location, followed by an AI prompt saying, “You are currently at...” [The location is unclear in the source.] But the design of this screen itself—

Speaker 5 00:18:13
There is nothing wrong with it.

Speaker 2 00:18:16
It is fairly simple and clear. It also brings together the practical everyday features you need locally.

Speaker 1 00:18:31
Okay, could you open Ask This Place and look at the interface inside? What do you think?

Speaker 4 00:18:40
[Unclear background speech about putting something in.]

Speaker 3 00:18:51
Have you finished? [Remainder unclear in source.]

Speaker 4 00:18:55
[Unclear background speech; includes “Didn't you hear it?”]

Speaker 1 00:19:00
It detects where I am and then gives an intelligent suggestion. For example, the scenario shown here is that you are at a GP clinic, a medical facility.

Speaker 6 00:19:13
At the time of a year. [Unclear fragment in source.]

Speaker 1 00:19:14
It recommends these small features below.

Speaker 2 00:19:23
I think this screen itself is quite simple. But if I imagine being in that situation, tapping through these options would still take time.
The page itself is good. If the information could be brought together on the home screen, or if I could access it with fewer taps, it would be more convenient.
The current design is still quite clear.

Speaker 1 00:19:57
Okay, I need to type something in a moment. Earlier I showed you the journey feature, where you plan a route and then look at the map as you walk. Would it help to put a quick Ask This Place shortcut on that screen?

Speaker 2 00:20:30
I think that would be helpful. Assuming I can look at my phone from time to time while travelling, I would certainly want to make as few extra taps as possible.
For example, during a journey, I might otherwise have to open one screen, tap again, tap here, and enter another section.
If those buttons appeared automatically on the screen I am already looking at while walking, it would be easier. It could show that I have reached a place, and a suggestion could pop up for me to see directly. That might be better.
The current design itself is simple and clear. Keeping the features separate has not caused confusion or misunderstanding.
There is just room to reduce the effort and time required. The ideas themselves are useful and have practical value.

Speaker 1 00:21:41
Understood. Now, after experiencing all our features, please briefly answer three questions. Which feature best meets your needs? Which would you probably not use? And if we changed only one thing in the next version, what should it be?

Speaker 2 00:22:05
Which is most useful and most relevant to me? Perhaps the AR scanning feature in Tools. Assuming the AI integration works well and recognition is accurate, when you arrive in a new country, there are many unfamiliar things: local customs, urban design, signs, and infrastructure. They will not be exactly the same as in other countries.
So an international student arriving for the first time could use this AI feature to quickly understand things they see on the street.

Speaker 1 00:23:00
Okay, which feature would you not use? Or which seems less helpful than the others, or could be replaced by another app you prefer?

Speaker 2 00:23:23
Actually, I think every section of the app has a reason to exist. But if I were seeking medical care, I would want that screen to be more streamlined, because there is a lot of text and it requires a lot of tapping and reading.
In practice, I might prefer to read other people's actual experiences. The healthcare section is a bit like a manual. I still think it is necessary; I am not saying I would never use it.
If the design were simpler or the AI integration made it smarter, I might use it more often. If I urgently needed medical help, I might think of using this app first, rather than another approach.

Speaker 1 00:24:24
Okay. Finally, if we changed just one thing in the next version, what should be the highest priority?

Speaker 2 00:24:36
If there were only one change, I would add shortcuts to, or integrate, the AR and location-based recommendation features from Tools into the first two screens. I would count that as one change. If these two features work accurately, they could be used very frequently.

Speaker 7 00:25:09
There is another one healing on the stairs. [Apparently unrelated background speech.]

Speaker 2 00:25:14
When I am using navigation or the journey feature, I should be able to use these functions directly on that screen, without going to Tools and tapping once, twice, or perhaps three times, then returning to the screen I was using. [Additional phrase unclear in source.]
If I could change only one thing, I would add shortcuts for those two functions and display them on this screen.

Speaker 1 00:25:50
Okay. We have now gone through the overall experience. Is there anything else you would like to say? Let us finish by briefly discussing the visual style and your overall impression of the interface. What do you think of the visual design? Is there anything to improve or change?

Speaker 2 00:26:22
The visual design is simple and professional. There is nothing particularly confusing, and the icons and design choices are fairly rational. Overall it is quite good, with a professional, practical feel.

If you wanted to add more fun or entertainment, I noticed you already have experience points, badges, honours, and achievements, rather like game achievements.
In the journey section, where you have the trip-planning layout, you could perhaps add more lively elements. Of course, the design works well across the app: it is simple and clear, and the overall colours are bright.
The extensive use of white, blue, and light blue feels rational and professional. But I would like more of a travel atmosphere, especially in the journey section, because the other sections have a strong practical purpose.
The journey feature is also a tool, but I would generally use it when I wanted some excitement or something enjoyable.
That section could include livelier elements, colours, small animations, or perhaps more expressive character illustrations.
There is another UI point about AR. The screen itself is good, but imagine I am on the tram. First I have to tap into AR—actually, starting from the home screen, that is one tap, then another. After scanning, perhaps tapping this button could be optional if it recognises the object automatically.
Then there is a third tap, and perhaps a fourth below. I end up checking several things, standing in one place staring at my phone for quite a while.
That makes the screen slightly complicated. The 30-second [format unclear in source] may also take time. Still, the feature itself is necessary.
The content is rich and detailed, and sometimes it could be simplified. The design itself is good; I am not saying it is fundamentally flawed.
If this feature, especially the AR recognition, is highly accurate, it could be used very frequently. Reducing the number of taps and the time needed would make it even better. That is just my personal suggestion for improvement.
If users like this app and come to rely on it whenever they go out after arriving in Melbourne, they would want the practical parts to be simpler and the more human-oriented parts to have more energy and fun.
That is my feedback on the UI.

Speaker 1 00:30:41
On the design, yes. We have now covered pretty much everything, and the other participants have also raised these points. Thank you again for spending so much time on this study.
After the meeting, I will send you the consent form. Please sign it, as that confirmation is important for our research.
Thank you again for taking part. Thank you. You're welcome. [Closing exchange transcribed under one speaker in the source.]

P2 — English Translation

00:00:00 Test opening and project background
00:01:22 Participant background and experience of local life
00:02:52 Short Trip demonstration and feedback

00:10:42 Healthcare process guide walkthrough
00:22:39 Discussion of AR recognition and the contextual assistant
00:34:50 Feature priorities and overall improvement suggestions

Speaker 1 00:00:00
It has started.

Speaker 2 00:00:01
Okay. First, let us introduce ourselves. We are University of Melbourne students, and this is a brief study of the features in an interface prototype we have developed. First, I need to clarify that Day One is an app concept designed to help people newly arrived in Melbourne become familiar with local life. Today we will show short trips, the healthcare process, and two tools for assistance on site.
It is not a complete app. Some parts are clickable, while others require us to switch screens manually. We have not built a backend; this is only a frontend prototype.
We mainly want to find out whether you understand the screens, whether they are accessible, and whether these features help you. We are testing the design, rather than your abilities, so please point out anything unclear, unnecessary, or different from what you expected.
You can also withdraw at any point.
The interview should last around 15–30 minutes. We will record what you say and your shared-screen interactions.
After the meeting, we will send you a form to read and sign, because we need your confirmation that you agree to participate in this test.

Speaker 1 00:01:20
Okay.

Speaker 2 00:01:22
Let me start with a few simple background questions. How long have you been in Melbourne, and how familiar are you with everyday life here?

Speaker 1 00:01:30
About six months. I know a little about the area around the university and the city centre, but I am not very familiar with the surrounding areas.

Speaker 2 00:01:43
When you first arrived, did you encounter an unfamiliar everyday process? What was it, and how did you deal with it?

Speaker 1 00:01:51
Yes. For example, I did not know how to catch a tram: how to touch on and off, or how to tell which tram was arriving. I only tried it later when I worked on a group project with other classmates and took the tram with them.

Speaker 2 00:02:09
Do you usually use any tools or apps to learn about local services or processes?

Speaker 1 00:02:22
For finding places, I mostly use Google Maps. I also use Xiaohongshu to look up information.

Speaker 2 00:02:32
Have you had any experience seeking medical care in Australia, such as finding a GP or booking an appointment?

Speaker 1 00:02:39
I did in Canberra, but not in Melbourne. In Canberra I wanted a Chinese GP because communication would be easier, but the clinic was very far away. In the end, I could not be bothered going. [Final fragment unclear in source.]

Speaker 2 00:02:52
Understood. Let us begin with the first feature, the map-based Trip feature. I will briefly explain the screen, and because there is no fully functioning process, I may need to guide your interactions. Imagine you have just arrived in Melbourne and are going to the University of Melbourne. You are not in a rush today and would like to get to know nearby places along the way. Let us see how the app could help.
First, look at this screen. If you wanted to plan this outing or begin a short journey, which button would you tap?

Speaker 1 00:03:30
Probably Start.

Speaker 2 00:03:31
Okay, do not tap Start yet. First, what can you see on the map itself?

Speaker 1 00:03:41
The circle should be my current location. There is a tram stop here. Further down, the map shows the law school building. There is a café here, and the tick may mean I have visited it before.
This is a library, also marked as visited. I do not really understand the question mark. That is about what I can see.

Speaker 2 00:04:13
Aside from those things, is anything on the screen confusing or unclear in meaning?

Speaker 3 00:04:22
The whole screen... four. [Fragmentary speech.]

Speaker 1 00:04:35
The four icons at the bottom: Explore probably means this map. Does Simulate mean it will simulate a route after I have selected a day's trip? I am not sure. I am also not sure what will be inside Tools.
That is about it.

Speaker 2 00:04:56
Okay, let us move to the next screen. Please tap Start.

Speaker 1 00:05:01
Okay.

Speaker 2 00:05:03
You can scroll around this screen freely. We mainly want to see what you think of the interface design.

Speaker 1 00:05:13
“You head.” [English fragment as transcribed.] First I need to think about where to go. [Unclear fragment.]
So exploring the campus also gives me experience points.
I can find an exploration route here, and there are some other route suggestions.
I cannot mark anything on the map, so I can only scroll and search below.
For example, Library—I cannot tap that yet either, right?

Speaker 2 00:05:56
Yes, some features have not been implemented. This is how it currently works.

Speaker 1 00:06:00
Let me look at this. I can open this one. Okay, from home to campus, it recommends a café, shopping, then the stop, and then here.
So it designs a route where I can get coffee first and then take transport. Wait a moment.

Speaker 2 00:06:29
The order is a little mixed up. This is that kind of— [Unfinished statement.]

Speaker 1 00:06:37
You can save it, and then, for example, start.

Speaker 2 00:06:43
I need to interrupt briefly. This screen simulates what you would see while holding your phone and walking along the route.
We do not have the actual functionality, and you are not testing it outside on your phone, so we have only made a simple demonstration of what the phone would show during the trip.

Speaker 1 00:07:01
Okay. These are the marked locations, a bit like graphical points showing how many you have completed.
I do not quite understand the experience points. Why does this give 100? How is that calculated?
The next checkpoint is the market. It introduces the market, and I can pause and view its details.
Okay.

Speaker 2 00:07:36
That is all for this screen. We are now at the final screen.

Speaker 1 00:07:42
Okay, so this is the results screen after finishing the trip.

Speaker 2 00:07:45
Right. Looking back at the overall interaction and process, I can first explain the feature, and then you can consider whether it would help you. But first, could you tell me what you understand this feature to do?

Speaker 1 00:08:04
My understanding is that if I am going somewhere today but also want to visit a few other places, it can plan a route and guide me around them, almost like a to-do list.
If I do not know the area, it can also recommend a route and introduce the places.

Speaker 2 00:08:27
That is a very thorough understanding. It is indeed a bit like planning a short trip. You can choose any destination, and after you set it, we recommend a route so you can get to know the surrounding area on the way.
Looking back over the process, how clear are the screens? Was there too much text, too many elements crowded together, or anything you could not understand because of the interface design?

Speaker 1 00:09:12
One thing is on the second screen. After I have selected this destination, how are these other suggestions generated?

Speaker 2 00:09:24
So you are not sure why it recommends them?
Yes. [Brief response included in the same source turn.]

Speaker 1 00:09:29
I have already decided to go to the university, so are those two places on the way, or why are they recommended?

Speaker 2 00:09:36
I can explain that. Those are alternative destinations. If you have no idea where to go today, it offers recommendations.

Speaker 1 00:09:47
Okay. Then everything else seems quite clear.

Speaker 2 00:09:53
Now let us talk about rewards. You saw rewards such as 250 XP, which are part of an achievement system.
Would adding achievements to the journey—such as a small badge after exploring a place—motivate you to explore nearby areas and use this feature more?

Speaker 1 00:10:23
If the points eventually became other badges or unlocked achievements, that would help. It is like games putting treasure chests around the world to encourage exploration.

Speaker 2 00:10:42
Okay, let us move to the next feature. First return to the main screen, then tap Simulate below. This second feature is quite simple. It is like a manual that takes you through the whole process step by step. For example, if you do not know the healthcare journey or how to find a GP, you can learn it here.

You can see different categories at the top, including Transport, Driving, and Campus. We have only built Healthcare, so that is what we will test today.
This process is relatively complete, so please go through all of it first, and then we will ask questions. Open the first step. I should explain that if you scroll down, you will see three options: GP, [second option unclear in source], and ED. We have only implemented the GP branch.
If the app were fully developed, selecting different branches would change the later steps. For today's test, we assume you select GP. That is all from me; please go through the process.

Speaker 1 00:12:06
There is an introductory video. It recommends GP for a mild condition. Okay, start with GP.
It separates users into groups, including overseas students.
Insurance, online booking platforms... [English fragment unclear in source.]
This is an introduction. Okay. [Unclear reading fragments.]
Common booking methods. [Unclear reading fragments.]
Consultation length, appointment type, cancellation. But these are only instructions; they do not link to a particular service or let me select a clinic to book on the map.
Step four: preparation before the appointment.
Overseas students, medication, symptoms and questions—so this is a preparation checklist.
Then step five. Okay.
After the consultation. Payment. I see.
For prescription medicine, I need to see a pharmacist.
Test results. Other [unclear in source]. Okay.

Speaker 2 00:14:40
I need to explain this screen too. It cannot function normally because we have not built the backend. This is a small simulated scenario or exercise. For example, in this scenario, you have just arrived at a clinic without an appointment. What would you do?
There would be questions and answers. For example, the doctor might ask about your not having an appointment. You could tap Speak below and answer aloud.
We expect to integrate AI in future to provide scenario-based speaking practice, helping you know how to answer in a particular situation. Below, there would also be some quick [tips; wording unclear in source].
That is roughly how it works, and that is the full process. Looking back, first let us discuss the interface. What do you think overall? Is there too much text or too many elements? You can share problems or positive points.

Speaker 1 00:15:51
I think the overall interface is clear. Once you choose an option, there is a detailed manual explaining the full process. It feels like a general framework everyone can follow. You do not finish reading and still have no idea what to do. I find it helpful.

Speaker 2 00:16:15
What about the amount of text? Is there too much, or is anything insufficiently clear?

Speaker 1 00:16:25
The issue is that if I want to do it one step at a time—for example, today I only want to confirm that I need a GP and find out where to book—I may only need the first two steps. I just want to see those, make the booking, and leave.

So I may not need such a continuous process taking me all the way to the end.

Speaker 2 00:16:58
Okay, give me a moment to take notes. Am I right that you do not need the whole process to be so continuous, and would prefer being able to enter each step separately?
Yes. [Brief response included in the same source turn.]

Speaker 1 00:17:23
For example, after entering Care Type or confirming GP, there could be a similar screen where I choose whether I am at step one, two, or three. The entries could also say “before you start” or “afterwards.” I could go straight to the relevant item and read its instructions.
The AR Q&A assistant could be available alongside it. If I have a specific question, I could ask at any time instead of waiting until the end to simulate it.

Speaker 2 00:18:02
So you think the AR scenario simulation would fit better within the corresponding individual items?

Speaker 1 00:18:11
Put it here. I am not entirely sure how the hierarchy should work. My question might be which clinic to find or what I need to bring.
It could link me directly to the relevant item, in this navigation area.

Speaker 2 00:18:39
Okay.

Speaker 1 00:18:44
And if I wanted to simulate a consultation, I could practise from this screen too.

Speaker 2 00:18:54
Understood. You would like a clearer choice on this screen: freely choose simulation or look carefully at each step, rather than placing everything at the end?

Speaker 1 00:19:09
Yes, because I am not sure native speakers would need that kind of simulation. They might just go there and speak directly.

Speaker 2 00:19:18
That is true. In terms of functionality, if you did not know how to seek medical care, would this feature help?

Speaker 1 00:19:39
If I were a user of this app, and it comprehensively integrated these everyday tools and updated them quickly enough, I think it would.
It needs to ensure its information is sound so I can trust its advice. Otherwise, I might choose more current websites or posts to check the information.

Speaker 2 00:20:09
So trustworthiness is the most important thing?

Speaker 1 00:20:14
Yes, and how current it is.
It cannot tell me exactly which clinic to go to or connect with Explore to find places within my area. For example, if I want a female Chinese GP, where would be most suitable? Without specific personalised recommendations, it feels more like a manual.

Speaker 2 00:20:53
Okay, give me a moment. We can move to the next feature—actually, I forgot one final question. AI is quite advanced now, and many people might prefer to use it when seeking medical care.
Compared with this feature, what advantages does a general AI tool such as [tool name unclear] or GPT have? And what are our advantages?

Speaker 1 00:21:35
I am actually hesitant to ask medical questions directly of a model that does not have a specialist knowledge base.
It is not professional enough but is very confident, which could lead to a lot of misdiagnoses. So I would trust it less.
With something like this, if it can at least ensure that its information is reliable, I think it is useful as a reference.
Its disadvantage is that it is not connected to timely or personalised information. For example, I could ask Gemini to find clinics around a particular location and tell me their opening hours. Here, I would still have to look through websites myself.

Speaker 2 00:22:39
Okay, let us move on. Please tap Tools. This feature also involves complex backend functionality that we have not implemented. We only have the prototype screens.
Before I explain it, looking only at this screen, what do you think it can help you do? Can you quickly understand the feature?

Speaker 1 00:23:07
AI Lens. Then touching off when getting off. These are small tools: translation, tram zones.
What does Health Support do? Fares and rules.
My understanding is that it recognises streets or facilities from photos, then uses AR and backend analysis to explain how something works or what its rules are. It is a kind of guidance for basic everyday needs.

Speaker 2 00:24:00
Yes. Please open AR recognition. Again, because there is no interaction implemented, we can only show the screen. Now tap Details.

Speaker 1 00:24:18
Details. Okay. It explains what this is.

Speaker 2 00:24:26
Let us discuss this feature by itself. You have seen the two basic screens. Imagine using it in real life: would it be useful to you?

Speaker 1 00:24:46
When I first arrived in Melbourne, I had no idea where the free zone was, so it would have helped me decide whether to touch on. But this does not actually tell me whether I should touch on, does it? Does it just introduce the device?

Speaker 2 00:25:07
Yes, it is more of an explanatory feature. If you scan something unfamiliar, it introduces it. It is not limited to myki readers.

Speaker 1 00:25:21
Then it would help if it explained whether I can use a public transport card, Visa, or Apple Pay here, for example.

Speaker 2 00:25:35
You want the Details screen to say more explicitly what you can use to pay, rather than just explaining the fare structure?

Speaker 1 00:25:44
Yes. Machines like this look similar around the world. What I need to know is which card to use and whether I need to touch on at all.
Also, boarding takes very little time. I am not sure whether people have enough time to scan and get past the social awkwardness of standing there waiting to take a photo.
The tourists I have seen usually touch on quickly when boarding, so I am not sure about this issue.

Speaker 2 00:26:30
Okay, return to the original screen. Now open the second feature, Ask This Place, through AI Guide. Since it involves AI integration, I can only give a brief explanation.
Based on your current location, it automatically offers quick recommendations or quick simulations. Here we assume you are in a GP clinic. It automatically recommends GP support, such as describing your symptoms, practising talking to reception, or quickly learning what a referral is. You can also ask questions freely. That would be implemented by integrating another AI system.

Speaker 1 00:27:22
Okay.

Speaker 2 00:27:23
Based on the scenario I just described, would this be useful to you?

Speaker 1 00:27:34
It feels like one task has been split across two places: Simulate does it, and Tools does it too.
That feels a bit odd, although the feature itself is useful. If I am unfamiliar with a place or the healthcare process is very different from my own cultural background, learning about it beforehand is a good idea.
But having the full explanatory process in Simulate and the actual simulation in Tools feels a little confusing.

Speaker 2 00:28:17

Perhaps my explanation was unclear. This is only one example, and it depends on your location. When I say “simulation,” I mean imagining a usage scenario, rather than the app simulating something.
For example, in this scenario I happen to be at a clinic. Based on that location, the AI automatically recommends some quick support.

Speaker 1 00:28:49
If it only recommends things once I am there, that might be a little late. At that point, I am already in a face-to-face conversation in real time, so there may be no opportunity to practise.

Speaker 2 00:29:09
This is not a simulation; it is a Q&A system like regular AI. It simply gives quick recommendations based on your current location.
For example, if I go into Victoria Market and open the AI, it could automatically show shortcuts for good food nearby or how to talk to people. Tapping them would bring up the relevant recommendations.

Speaker 1 00:29:37
That scenario seems useful. On Google Maps, many places do not appear unless you zoom in, and some do not appear even then.
Recommendations like that could help. If I am looking for food, it could collect food recommendations together. If I want to buy something from a stall, quickly checking what to say would be useful too.

Speaker 2 00:30:08
Looking only at the interface, is there too much information, or does it look a little cluttered?

Speaker 1 00:30:25
On this screen... how should I put it? It feels like the whole screen is customised to the location where you open it. [Repeated, unintelligible fragments in source.]

Speaker 2 00:31:00
What exactly are you unsure about?

Speaker 1 00:31:02
This is a clinic scenario, so symptoms, conversation, referrals, and what happens next may indeed be the four most relevant recommendations to show here, with real-time AI Q&A below.
At Victoria Market, the recommendations might instead be food, spoken conversation, a shop map, or parking. They would differ by location.
If an algorithm or people's searches determines the top four, that seems reasonable. The current interface is quite simple too.

Speaker 2 00:31:52
Okay, return to the original screen. We have not made entry screens for the other features, but I can explain them briefly.
Quick Tools is easy to understand. Translate is similar to AR and helps you quickly understand what a sign means. Free Tram Checker tells you whether you are inside the Free Tram Zone. Support Contacts helps find nearby GPs or emergency assistance.

Recent Scans is your history, allowing you to revisit things you scanned before.
Do you think these three Quick Tools features, and the other features we have not discussed, would help you?

Speaker 1 00:32:45
Quick Tools could use categories, because these three are quite different.
If I am checking public transport, I may already have photographed the reader and been told I do not need to touch on inside the free zone. Having to go back out and find Free Zone Checker to confirm whether I am inside it makes the process a little confusing.
Health Support Contacts could be connected to Simulate. When the guide explains how to contact a clinic before visiting, it could say, “Now use this tool to find nearby clinics.” That would make the process flow better.

Speaker 2 00:33:31
So you think these tools would fit better within other features rather than being separate?

Speaker 1 00:33:40
They can still be separate, but also linked to other features. Quick jumps between them would be more convenient.
And if more small tools are added later, categorising Quick Tools would make it clearer.

Speaker 2 00:33:57
Now that you have seen all these features, how would you rate the overall design of this screen? Is it clear enough?

Speaker 1 00:34:12
Let me think. At the top there is scanning to understand something, followed by location-based recommendations, then small tools. That seems fine.
This screen focuses on immediate needs: what help might I need at the place where I currently am? I can open it and do what I need. That is fairly easy to understand.

Speaker 2 00:34:50
We have now looked at everything. I have a few final questions. Of all the features shown, which best meets your needs?

Speaker 1 00:35:07
Let me think. Free Checker is certainly important and necessary for newcomers. Simulate could also help once the transport content and other sections are completed.
But those are things newcomers might check once when they arrive, rather than repeatedly, so I am not sure whether continued use would be high.
For Explore, if the map had more fun features, such as unlocking places, that would be interesting. It would distinguish it from Google Maps, and I would be willing to try it.

Speaker 2 00:36:02
Speaking of the Explore map, what do you think of the visual style on the current screen? Is it okay?

Speaker 1 00:36:16

For a map, what matters to me is clarity and clear place markers. This style is fine as long as things are easy to recognise.

Speaker 2 00:36:36
Next, which feature would you probably not use?

Speaker 1 00:36:41
The AI scanning feature for the tram reader, because that happens so quickly in everyday life. Before the scan finishes or the Wi-Fi connects, I may already have touched on, then realise I was in the free zone. That would be a disaster.
It would be useful if, before boarding, I were at the stop and opened the contextual assistant, which prompted me to check whether I was in the Free Tram Zone.

Speaker 2 00:37:21
Okay, let me write that down. Finally, if we could improve only one thing in the next version, what should we prioritise?

Speaker 1 00:37:49
Only one thing?

Speaker 2 00:37:51
You can mention other ideas, but mainly the highest priority.

Speaker 1 00:37:56
I would like these small tools linked to Simulate. It already clearly explains how to book, so attaching the GP tool at that step would be useful, especially if it searches nearby places.

Speaker 2 00:38:27
Okay. Any other comments you would like to make?

Speaker 1 00:38:38
I am thinking about this screen. Different places would have completely different screens, but the current style feels a little corporate.

Speaker 2 00:38:55
I understand. It feels like an ordinary utility app and is not very vibrant?

Speaker 1 00:39:03
Yes. For example, recommending food with just a food icon feels a bit odd.

Speaker 2 00:39:13
Understood. In terms of visual design, when it recognises your location, it could show something like a photo of Victoria Market when you are there. Would that be better?

Speaker 1 00:39:28
Yes, something that better matches the character of the place.

Speaker 2 00:39:33

Okay, that covers all our questions. Thank you very much for taking part. We will send you the form afterwards; please sign it.

Speaker 1 00:39:46
Okay, no problem.

P3 — English Translation

1. Opening and Background

Interviewer: Thank you for joining today's test. Day One is an app concept that helps international students newly arrived in Melbourne become familiar with local life. Today we will test Short Trip, learning the healthcare process, and two tools for assistance on site. The prototype is incomplete, and some screens may not be clickable. We are testing the design, rather than your ability, so please share anything you find confusing.
Interviewer: How long have you been in Melbourne?
Participant: This is my fifth year.
Interviewer: How familiar are you with everyday life here now?
Participant: I am very familiar with the areas around where I live and around the university.
Interviewer: What unfamiliar everyday processes did you encounter when you first arrived?
Participant: At the bank, I was unfamiliar with how floors are named. Here, Ground is the ground floor, and Level 1 is the floor above it. That is different from China.
Interviewer: How did you resolve it?
Participant: I wandered around for a long time before working it out.
Interviewer: What tools do you usually use to check routes or learn about local services?
Participant: My phone's built-in map app and Xiaohongshu, where I read other people's posts.
Interviewer: What problems do those tools still fail to solve?
Participant: Many posts only provide an address. Some shops are hidden in a corner or upstairs, so even with the address they are difficult to find.
Interviewer: If you needed to book a service, would you know where to start?
Participant: No.

2. Short Trip: Local Exploration

Interviewer: Imagine you have just arrived in Melbourne and are going to the University of Melbourne. You are not in a hurry and would like to get to know the neighbourhood along the way. Where would you start planning?
Participant: I would find my location, then look for a search page and enter the destination. But I cannot see a direct input field here, so I would tap Start first.
Participant: On the next screen, I can see Search Destination. I would enter the destination, tap Generate, and follow the directions.
Interviewer: What do you think the generated route will help you do?
Participant: Take me to the university and tell me what I will pass along the way. If there is a café, I might buy a coffee. Knowing what is along the route also helps me confirm I am going the right way.

Interviewer: Is there enough information on the page to decide whether to start this route? Is it easy to read?
Participant: Yes, there is enough, and I can read it clearly. The route information is also quite clear.
Interviewer: Are these places compulsory stops, or can you choose them yourself?
Participant: I would like to plan according to my needs: buying coffee or food on the way, or getting groceries on the way home after class. I could organise everything in one outing.
Interviewer: When would you use Short Trip instead of Apple Maps or Google Maps?
Participant: For example, if I were hungry at university and wanted to see what food was available on my way home.
Interviewer: After starting a Journey, how would you view the next stop or pause?
Participant: There is a Pause button in the bottom-right corner. I would tap that.
Interviewer: What would you like the screen to tell you after finishing the route?
Participant: How many steps I walked and how long it took. I could use that to estimate the time needed to get to university next time. If I bought coffee, I would also like to see how long I spent there.
Interviewer: Would rewards be useful for someone newly arrived in Australia? Would they affect use?
Participant: They would probably work well for newcomers. I have been here a long time, so I can explore on my own and do not really need them.
Interviewer: To clarify, Short Trip does not require you to spend money at every stop. It recommends different detours and places along the route between home and university, helping new students gradually get to know the surrounding community.
Participant: That would be particularly useful for new students and help them understand the community better.

3. Healthcare Journey / GP Process

Interviewer: Imagine you have just arrived in Melbourne and want a non-emergency health consultation, but do not understand the local healthcare process. Where would you enter?
Participant: Healthcare in the Journey Tree.
Interviewer: In what order do you think these steps and statuses should be used?
Participant: First choose the type of care, such as internal medicine, surgery, or orthopaedics, then find a doctor and an appointment time.
Interviewer: What do you think this feature does?
Participant: Books an appointment with a doctor.
Interviewer: It is actually a simulation-based learning tool to help users understand the Australian healthcare process. It does not make real bookings.
Participant: Understood.
Interviewer: Reading the care selection page, what do you understand it to be saying?
Participant: It explains the types of healthcare services in Australia. GPs are for non-urgent situations, Urgent Care is for urgent but non-life-threatening conditions, and Emergency is for life-threatening conditions. I can choose according to my situation, or call for advice if I am unsure.
Interviewer: As you browse the GP process, what do you understand each step to involve?
Participant: I can find a GP through the university or my insurer and check fees, languages, and location. Then I learn how to book, prepare for the appointment, and handle cancellation. Next, I explain my situation to the doctor. Finally, I pay, get reports, or collect medication.
Interviewer: What is this simulated conversation screen for?
Participant: I thought it booked doctors for walk-in patients or provided advice.

Interviewer: It mainly simulates questions that may arise when seeking medical care, helping new students with language barriers practise speaking beforehand.
Participant: I see.
Interviewer: If you really wanted to book a GP, is the current process complete?
Participant: I have not actually seen a doctor here, but based on what I know, it seems sufficient. The booking and consultation process is fairly comprehensive.
Interviewer: Are the differences between services on the care selection page clear?
Participant: Very clear.
Interviewer: After reading the step about finding a GP, where would you look?
Participant: University health services or my insurer's official website, searching for available GPs.
Interviewer: What would you confirm before choosing?
Participant: First, which insurance company I am with.
Interviewer: How would you book next?
Participant: I dislike phone calls and would prefer an online form. I have never booked a doctor's appointment by phone.
Interviewer: Are the later steps clear? What else do you need before you can act?
Participant: I would like to know how to describe my symptoms. But some information may also be too detailed. Overall, the booking and consultation process is fairly complete.
Interviewer: Is there anything uncertain or untrustworthy that would stop you from moving to the next step?
Participant: No.
Interviewer: Which helps most: videos, text and images, or simulation exercises?
Participant: The simulation made the best impression. It better recreates what international students experience when finding a GP, booking, and attending a consultation.
Interviewer: Between images, articles, and videos, which do you prefer?
Participant: Images and videos. The articles are too long; I would like less text.
Interviewer: Are the detailed step-by-step explanations helpful?
Participant: Yes. They explain things in detail.

4. Driving Learning Feature

Interviewer: There is also a driving learning module. It first asks whether you hold a licence from another country, then explains differences between driving there and in Australia, local road signs, and special traffic situations. It uses scenario simulations and quizzes to help you learn. How do you understand it?
Participant: It is like a driving theory test preparation app, with realistic road situation simulations too.

5. AR Scan: Recognition on Site

Interviewer: Imagine you see an unfamiliar device on a tram and want to know what it is and how to use it. This prototype demonstrates the scanning concept but cannot actually scan. What would you do?
Participant: I would see Start Scanning, tap it to scan the unfamiliar object, and look at the recognition result.
Interviewer: Does the explanation after recognition answer your questions?
Participant: Yes. I want to know what it is, how to use it, how much it costs, and so on.
Interviewer: When would you use scanning?
Participant: Initially, I cannot think of a specific situation.

Interviewer: For example, scanning Melbourne's distinctive hook turn signs, kangaroo warning signs, or parking signs could explain their meanings and rules.
Participant: That sounds good.
Interviewer: How much information should the scan result display? Do you need a long explanation?
Participant: I do not want a huge explanation like GPT gives. First, I want to know what it is. If I need to use it, I also need instructions. The current brief introduction with Details is good: I can tap for more if I want.
Interviewer: What if it identifies something incorrectly?
Participant: I would like to report the incorrect recognition and scan again. If it is still wrong after rescanning, I would submit an error report.

6. Ask This Place: Location-Based Help

Interviewer: Imagine you have arrived at a clinic and need to explain why you are there or ask reception a question. Ask This Place provides preset conversations and practice relevant to the location. Do you have any questions?
Participant: Will it support my native language? What if my native language is not English?
Interviewer: Multilingual support is planned for the future.
Interviewer: If you were going to the clinic tomorrow, where would you start?
Participant: I would tap Talk to Reception first to learn how to check in. If I really had an appointment tomorrow, I would think beforehand about how to describe my symptoms in English.
Interviewer: What other practice or information would you like added?
Participant: Nothing comes to mind at the moment.
Interviewer: How does it differ from an ordinary search tool?
Participant: A search might only tell me how to book at a hospital or tell me to go to reception, without saying where reception is or what to do once I get there.
Interviewer: This tool provides common conversations based on the actual place. You can also ask specific questions about the local clinic, such as whether your insurance is accepted.
Interviewer: Is the location information presented clearly?
Participant: I would like it to show the clinic name directly, rather than only the address.
Interviewer: Would you like step-by-step guidance on describing symptoms and talking to reception?
Participant: Yes, a standardised process would help avoid unnecessary or incorrect descriptions and resolve things more efficiently.

7. Final Feedback

Interviewer: Of the features shown, which would best meet your needs if you had just arrived in Australia?
Participant: The feature for finding medical care, Healthcare Journey.
Interviewer: Which would you probably not use?
Participant: Exploring the community, Short Trip.
Interviewer: If we could change only one thing in the next version, what would you most like changed?
Participant: Keep community exploration optional and add public transport details. For example, if I need a bus or tram to university, show which stop to board and get off at, fare zones, and related information.

P4 — English Translation

Day One — User Prototype Test Interview (Third Transcript)
Editing approach: Interviewer / Participant; casual conversation, equipment troubleshooting, and repeated verbal fillers have been removed. Original responses relevant to the research and necessary feature explanations have been retained.
Note: The speech transcript has been lightly edited for readability and is not verbatim. Explanations supplied by the interviewer should not be treated as the participant's spontaneous understanding.

01 | Opening and Background

Interviewer: Day One is an app concept designed to help international students newly arrived in Australia, especially Melbourne, become familiar with local life. Today you will try Short Trip, healthcare process learning, and tools for assistance on site. This is currently only a prototype, and some screens do not support full interaction. We are testing the design, rather than your abilities, so please share anything you find confusing.
Participant: Okay.

Interviewer: How long have you been in Melbourne?
Participant: A year and a half.
Interviewer: How familiar are you with life here now?
Participant: I am quite used to everything and fairly familiar with it.
Interviewer: What is the most recent unfamiliar everyday process you encountered locally?
Participant: For example, the first time using Click & Collect / Pickup at a shopping centre, I did not know where to collect my order or how the process worked.
Interviewer: What tools would you use to learn about that process beforehand?
Participant: I would search Xiaohongshu and also use Baidu Baike.
Interviewer: Have you booked a GP in Australia? If you needed to now, would you know where to start?
Participant: I have never booked one and have absolutely no idea where to start.

02 | Short Trip: Local Exploration

Interviewer: Imagine you have just arrived in Melbourne and are going from home to the University of Melbourne. You would like to become familiar with the nearby area along the way. Where would you start?
Participant: Start.
Interviewer: On the next page, what do you think you need to do?
Participant: Search for the destination, the place I want to go.
Interviewer: Where would you tap next?
Participant: Directly on the university, then generate a route.
Interviewer: What do you think this route will take you through?
Participant: First past a café, then to catch a tram, and then to “Weima” [Victoria Market]. This is a walking route that tells me what I will pass along the way.
Interviewer: What do you think is the purpose of this design?
Participant: It tells me which landmarks or shops are worth knowing about on my way to university.

Interviewer: Are these stops compulsory, or optional?
Participant: I think they are optional, because the route takes detours when there is clearly a more direct way.
Interviewer: When would you use this rather than simply looking up a route to university?
Participant: If I wanted to buy a coffee.

[Interviewer explanation] Short Trip is intended to do more than provide navigation or shopping stops. By recommending different routes and places each day, it helps new students gradually explore the area around the university. Future routes may also consider weather and sun exposure.

Interviewer: Do you know how to stop the route or check the next stop?
Participant: There is a stop button in the bottom-right corner.
Interviewer: Finishing a route earns rewards such as badges. Do you think these are necessary for newly arrived international students?
Participant: There is probably a place for them, because some people enjoy collecting cards and similar things.
Interviewer: Before I explained it, could you understand Short Trip's purpose directly?
Participant: Walking is the only route option, right? And each route includes several stops chosen by the app rather than by me, correct?
[Interviewer explanation] Walking is the main focus at present. Trams and other transport modes may be added later. Stops can be changed to suit preferences.
Participant: So I can choose for myself—for example, replace coffee with a dessert shop, buy something else, and then go to university?
Interviewer: Yes, you can personalise the choices.
Interviewer: Can you understand the statuses and progress bar during navigation?
Participant: It is like navigation, right? Yes, I can understand it.

03 | Healthcare Journey: Learning the Healthcare Process

Interviewer: Imagine you have just arrived in Melbourne and want an ordinary non-urgent health consultation, perhaps for a cold or cough, but are unfamiliar with seeing a GP. Which entry would you use?
Participant: The first one, Healthcare.
Interviewer: At first glance, what do you think this Journey does?
Participant: Explains the process of seeking medical care.
Interviewer: Do you think the six steps should be read in order, or selected freely like separate knowledge chapters?
Participant: I think they follow an order.
Interviewer: Would you be willing to read all the steps?
Participant: Yes, although there is a bit too much text.

[Interviewer explanation] The steps cover choosing a healthcare service, finding a GP, booking methods, preparing for the visit, the consultation, and subsequent payment or referrals. Some steps include videos and conversation simulations.

Interviewer: Were there any terms in what we just covered that you particularly did not understand?
Participant: No.
Interviewer: Are the differences between options on the care selection page clear?

Participant: Yes.
Interviewer: Which entry would you choose on the Find a GP page, and why?
Participant: The first one, because I am a student and it says For Students.
Interviewer: How would you book next?
Participant: By phone or online.
Interviewer: Do these pages connect smoothly?
Participant: Yes, they are okay.
Interviewer: Are any steps unclear, or should anything be added or removed?
Participant: Nothing at the moment.
Interviewer: Would you prefer to understand the whole process before going, or open the relevant step only when a specific problem arises?
Participant: I would read through the process beforehand.
Interviewer: Which helps you most: text, images, videos, or interactive simulations?
Participant: I think text.

04 | Driving: Driving and Road Rules Learning (Brief Demonstration)

[Interviewer explanation] The demonstration shows licence background selection, differences in driving sides and road signs between China and Australia, and learning Australian road rules through realistic traffic scenarios.

Participant: Does it teach me how to convert my licence to an Australian one, or just explain the traffic differences, after which I can drive straight away?
[Interviewer explanation] The module covers licence conversion, local road rules, and scenario simulations. Completing it does not mean you can immediately start driving.

05 | AR Lens: Scanning on Site

Interviewer: Imagine you see an unfamiliar card reader on a tram and want to know what it is and how to use it. This demonstrates an AR scanning concept and cannot actually recognise objects yet. Looking only at the page, how would you use it?
Participant: It seems like a real-time conversation. I can ask it, type, or speak to my phone to ask what the object is and how to use it.
Interviewer: Does the recognition result answer what you want to know?
Participant: It tells me this is a Myki Reader, but not yet how to use it. Will Details explain that?
Interviewer: Yes, it will explain how to touch on and other usage instructions.
Participant: Then that is clear. I can understand it.
Interviewer: When would you use AR scanning?
Participant: When I see something unfamiliar for the first time and do not know what it does or is for, I can ask.
Interviewer: How do you usually deal with that situation?
Participant: Ask AI.
Interviewer: Is the initial recognition screen informative enough? Is there anything else you want to see immediately?
Participant: I think it is okay. I can open Details for more.
Interviewer: What would you like to do if recognition is incorrect?
Participant: Scan again.

06 | Ask This Place: Location-Specific Assistance on Site

[Interviewer explanation] This tool provides answers and scenario practice for a specific place. For example, at a particular GP clinic, you could ask whether your insurance is accepted or how to speak to reception. Unlike general process simulations, answers should relate to the actual location.

Interviewer: Are any preset options unnecessary, or is anything missing?
Participant: It includes describing symptoms, talking to reception, and specialist referral letters. Can I also use the dialogue box below to ask questions outside those presets?
Interviewer: AI Q&A is planned, allowing users to ask other location-related questions.
Participant: Okay.
Interviewer: How does it differ from the ordinary AI chat tools you use?
Participant: It is more focused. If I knew it concentrated on healthcare, I might come straight here with questions.
Interviewer: What sort of answer would you like after asking a question?
Participant: Something practical and easy to understand, like a little assistant.

07 | Overall Assessment and Suggestions for the Next Version

Interviewer: Of Short Trip, Healthcare Journey, and the on-site tools, which best meets your needs?
Participant: The written process for finding a GP, because I really do not understand that process. Also the last tool, where I can ask about unexpected problems in a specific situation.
Interviewer: Is there any feature you would probably not use?
Participant: First I would like to know AR Lens's scanning scope. Can I ask about anything, or only scan transport- and healthcare-related objects?
[Interviewer explanation] The aim is to scan various everyday objects and select and summarise information useful to international students.
Participant: Then that is fine. There is no feature I would never use. I could use any of them if they came to mind.
Interviewer: If we could change only one thing in the next version, what would you most like changed?
Participant: The first map. I want to see nearby places directly on it, such as Victoria Market, cafés, and dessert shops, and choose where I want to go. I need to see what is around me before I can plan a route.
Interviewer: Would you prefer places displayed on the map or in the list below?
Participant: On the map. I could select the places directly and have it generate the shortest, most convenient route, connecting the places I want to visit in a sensible order.
Interviewer: So you want more personalised and flexible routes?
Participant: Yes.

— End of Interview —

P5 — English Translation

Speaker 1 00:00:00

Okay, first let me introduce the project. We are University of Melbourne students working on a capstone project. It is an app concept designed to help people newly arrived in Melbourne become familiar with local life. Today we will show short trips, the healthcare process, and two tools for assistance on site.
The test focuses on whether participants can understand the interface and features, and whether these meet real needs.
It is not a complete app, only a frontend prototype without a backend. Some things are clickable; elsewhere we need to switch screens. You cannot complete the whole process independently, so I will guide you through the next steps.
We are testing our design, rather than your abilities. Please point out anything unclear, unnecessary, or different from what you expected.
We will record the whole session, which should take around thirty minutes.
Let us start with background questions. I know you have lived overseas before. How long were you overseas?

Speaker 2 00:01:20
About two years.

Speaker 1 00:01:22
When you first arrived overseas, what unfamiliar everyday process did you encounter, and how did you resolve it?

Speaker 2 00:01:30
What do you mean by a delivery process? [The participant appears to have misheard the question.]

Speaker 1 00:01:33
An unfamiliar process you encountered.

Speaker 2 00:01:37
Perhaps getting to university. Where I lived was two or three kilometres away, but walking in Los Angeles was not very safe. So the options included public transport, Uber, or Lyft.
At first, I went with my housemates. We initially got a private car ride to university.

Speaker 1 00:02:14
Okay, let us go straight to the map feature. This does not have a complete working process, so you may need to follow my instructions in some places.
Imagine you have just arrived in Melbourne and are going to the University of Melbourne. You are not in a hurry today and want to get to know nearby places along the way.
That is our usage scenario. First, look carefully at the whole screen. Is anything unclear or difficult to understand? Based on your own understanding, tell me what this screen does.

Speaker 2 00:02:56
It seems to show important places around my current location and mark places I have already visited. There is also a question-mark location, perhaps to encourage me to go there.
My first impression is that it feels similar to Google Maps.

Speaker 1 00:03:30
In terms of design, does it have too much information, or anything that feels cognitively demanding?

Speaker 2 00:03:50
I do not really understand the level. Does it mean experience earned by exploring locations around the University of Melbourne, or progress, for example?

Speaker 1 00:04:11
Understood. I will explain the level after we complete the whole process. I would like your genuine reaction before you know what it is.
If you wanted to take a short trip now, which button would you tap?

Speaker 2 00:04:29
For a short trip, I would tap Start.

Speaker 1 00:04:32
Okay. Have you tapped it?

Speaker 2 00:04:38
Yes. Okay.

Speaker 1 00:04:44
As before, look over the whole screen and tell me what you think it does.

Speaker 3 00:04:58
The function is navigation.

Speaker 2 00:05:05
No, it should be giving users a destination and encouraging them to reach it.

Speaker 1 00:05:19
Is the information arranged sensibly? Is there too much or is it too crowded?

Speaker 3 00:05:30
Mm.

Speaker 2 00:05:39
At the bottom there is [unclear in source], while the map above occupies about half the screen and also has a marker.
I think it could use something like an [app reference unclear] card, showing that information directly on the map. That might make it look less crowded.

Speaker 1 00:06:08
So you find it crowded?

Speaker 2 00:06:11
Yes, because information is repeated.

Speaker 1 00:06:15
Where is the duplication mainly?

Speaker 2 00:06:19
I would like the lower card—the University of Melbourne information and “Popular for checkpoints”—placed directly on the University of Melbourne point on the map, as a card on the map.

Speaker 3 00:06:37
Then the map could actually show more.

Speaker 1 00:06:46
Okay, please tap Generate Discovery Route to go to the next screen.

Speaker 2 00:06:52
Okay.

Speaker 1 00:06:53
These next two screens go together. Look at Route Preview first, and then Start Journey below. You can look at both, and we will discuss them together.

Speaker 2 00:07:08
A journey... where is that?

Speaker 3 00:07:16
Okay.

Speaker 1 00:07:18
You can look for it.

Speaker 2 00:07:21
[Unclear fragment.] Start Journey. I have not found it. On Route Preview, I cannot see a Start Journey button or other option.

Speaker 1 00:08:00
I can tell you now: swipe up on the lower card.

Speaker 2 00:08:07
Swipe up? Damn. Because I am using the web version, I thought you meant a two-finger scroll. But here I have to click and drag upwards.

Speaker 1 00:08:22
Yes, it simulates phone interaction rather than computer interaction.

Speaker 2 00:08:29
Okay. “A smart way...” Preview. [Reading fragments.]

Speaker 3 00:08:40
Mm.

Speaker 1 00:08:48

Okay, please give an overall evaluation. The questions are the same as before: do you understand what the feature does, and what do you think of its interface design?

Speaker 2 00:09:01
I understand it. First, it displays a route you have preset, passing places worth visiting around the university.
After confirming the route, Start Journey begins real-time navigation. I can see detailed information about each place. On completion, I get points or experience to level up.
That is what I understand. The feature seems fairly complete. One thing to improve is that, although the final implementation might differ, the prototype currently offers only one route, and it is entirely walking.
That is because you are doing short exploration trips, right? The actual navigation is quite clear. That is roughly my view.

Speaker 1 00:10:29
Okay, move to the next screen. Tap the centre of the screen. Because this is a simulation screen, there is no explicit button taking you onwards. Tapping the centre should move to the next screen.

Speaker 2 00:10:44
Do you mean the Start Journey screen?

Speaker 1 00:10:48
No, have you already moved to the next screen? The one— [Unfinished statement.]

Speaker 2 00:10:55
Congratulations.

Speaker 1 00:10:56
The screen below Congratulations.

Speaker 2 00:11:02
Okay, the Congratulations screen. I can understand this too. As I said, it awards experience when you finish the route. It also gives statistics, such as time spent, distance walked, and whether you reached all the stops.
There are also some [marker wording unclear in source] and perhaps a button directing you to other places. That is all the information I can see.

Speaker 1 00:11:56
Let us evaluate the whole process rather than individual screens. Was it smooth? Did you understand what the feature was trying to do? If you knew nothing about Melbourne, would it help you get to know the surrounding area?

Speaker 2 00:12:21
First, the interface is clear and the functionality is complete.
If I were a new student in Melbourne, I might find it rather preset: the designers or developers have prepared routes for students. But users may want to search for places themselves, such as cafés or shopping malls.

I have not seen an option for that sort of user-initiated action yet. Otherwise, it feels like a customised Google Maps for Melbourne and the University of Melbourne, so I do not have much else to say about the interactions.

Speaker 1 00:13:37
Now let us test the next feature, the healthcare process. Tap Simulate below.

Speaker 2 00:13:47
Let me see.

Speaker 1 00:13:48
After tapping, you enter this screen. Let me briefly explain it, because this feature has a relatively complete interaction flow.
At the top of Simulate, you can see Healthcare, Transport, Driving, and Campus. These represent the complete processes for different topics. We have only built Healthcare, so please try the whole Healthcare process first. I will not interrupt, and we can discuss it afterwards.
First tap Choose Care Type. This would normally have three branches, but we have only implemented the first, so all the information you see afterwards is based on it.
If we complete the app, choosing another branch will change the information that follows. Please go through the experience now.

Speaker 3 00:15:01
One. One. [Isolated fragments.]

Speaker 2 00:16:18
Okay.

Speaker 1 00:16:21
Now that you have gone through it, the question is similar to before. I will not ask whether you understand the screen, since it is fairly explicit. In terms of the overall interface, is there too much information, or are there any problems with the arrangement?

Speaker 2 00:16:45
I do feel there is quite a lot of information. There are six steps in total, right? Step six.
Each step contains a lot, especially on a phone. It may lack a clear focus, even though you use different colours for things like pill-shaped labels.
A new student might indeed need all that information, but the interaction feels information-heavy and potentially difficult to keep reading.
Still, I understand the process, and its information coverage is complete.

Speaker 1 00:17:45
After reading it, do you have a general understanding of seeking medical care in Melbourne?

Speaker 2 00:17:53
Yes. As I said, the process is complete; some parts are just quite dense.

Speaker 1 00:18:06

Some previous participants raised another point. If I do not understand Melbourne's healthcare process, should I ask AI directly or use this app? What advantages and disadvantages does AI have compared with the app?

Speaker 2 00:18:27
AI has the advantage of “one shot”: you describe your scenario and it may give you the answer directly in one go.
Second, users can ask targeted follow-up questions about parts of the answer they do not understand. With this kind of fixed step-by-step process, users may encounter something they do not understand, but the app cannot provide personalised clarification. Those are the two points I would mention.

Speaker 1 00:19:13
If you had to name an advantage, what does our current step-based approach offer over AI? What value does it have?

Speaker 3 00:19:27
An advantage might be—

Speaker 2 00:19:29
It is relatively fixed and can be referred back to, because the content is written in advance. AI may give slightly different answers each time. That is about it.

Speaker 1 00:19:51
Okay, let us move on. The next feature involves AR and AI assistance. We have only developed the frontend, so there is no functioning backend. I can only describe it, and you will need to imagine using it.
Please tap Tools. Actually, after you went through the previous process, there was one final part I forgot to ask about.

Speaker 2 00:20:27
You mean the one just now?

Speaker 1 00:20:31
Yes. You did not tap Continue. What comes after Continue is also part of the process.

Speaker 2 00:20:38
Okay.

Speaker 1 00:20:40
You can now see a conversation-like screen. Let me explain it, because we cannot demonstrate it without a backend. We only have the screen image.
Think of it as scenario training. It presents a situation: for example, what happens if you go straight to a clinic without an appointment, what people might ask, and how you should answer.
You can answer freely. Afterwards, AI gives you a tip or suggestion.
Another example would be a café. I do not mean it recommends this based on location; I mean that if there were a café process in the app, it could end with a simulation of how to speak to people and place an order there. That is the intended purpose.

Would this help you become familiar with the clinic before visiting, and with local ways of communicating and expressing yourself?

Speaker 2 00:21:58
I actually think this is more useful. You could even make Simulate a standalone AI simulation product. Products for education or speaking practice are quite popular now, although this goes further and involves implementation cost trade-offs, so not everything works this way.
I find it more useful because it is more targeted and personalised. You can ask about issues the guide did not cover, and AI can simulate a realistic response and give tips. That seems more efficient.
You could also provide a summary after each conversation, showing users which parts they did well. Because users actually engage in the conversation, it may be more effective.

Speaker 1 00:23:18
Okay, now let us move to the next feature properly. Tap Tools, or go back to the previous screen and select Tools at the bottom [other interface label unclear in source].
You have opened it, right? Okay. We position Tools as a quick-access collection of functions. First, open AR Lens and tap Start Scanning to enter the demonstration scenario.
Here, imagine you do not know what a myki card reader does or how to use it. You open the camera, point it at the device, and scan it to get relevant information.
Tapping Details shows how public transport works, whether you are currently inside the free zone, the fare outside it, and which cards you need for payment.
We envision AR Lens scanning different machines and immediately showing information and details explaining what they do. For example, if I see a roadside ticket or transport-card machine when I first arrive and do not know what it is, scanning would explain what it is, its purpose, and the exact steps for using it.
That is the feature. Would it help if you were newly arrived in Melbourne and did not understand these local machines or processes?

Speaker 2 00:25:16
I think it would help a lot. Compared with the map features we tried, which Google Maps could easily replace because you can mark places yourself and go there, this is quite important overseas.
You have never lived there before, but these objects may be things you use frequently. Being able to perform a simple action and see the information would be very useful.

Speaker 1 00:25:48
You can now also take a photo and ask AI about it. Comparing that with having information pop up directly while scanning, which would be more useful or convenient?

Speaker 3 00:26:07
Mm.

Speaker 2 00:26:10
Leaving implementation aside, as a user I would care more about which gives more accurate and detailed results.
But since yours is only a prototype, we do not know its actual performance. Current AI capabilities are fairly good, but I do not know what level your AR feature could achieve.

Speaker 1 00:26:46

Setting accuracy aside and considering only the interaction, would you prefer taking a photo and asking AI, or opening the camera to scan an object and receive information directly? Which better matches your habits or seems more convenient?

Speaker 2 00:27:01
I think they are similar. AI can also open the camera and take a photo, so the interactions may be the same. As I mentioned, user experience would depend on time and answer accuracy.
If those two factors are outside the discussion because these are prototypes, the interaction flows seem similar.

Speaker 1 00:27:24
Okay, let us move on. Return to the Tools main screen and open the second feature, Ask This Place. Let me explain what it is. It is an AI chatbot providing quick recommendations based on your location. There is built-in AI.
For example, if it detects that you are in a hospital, it offers instant GP support, such as describing your current symptoms, talking to reception, or asking other common, immediate questions.
This saves you from typing the question yourself. That is the basic design: location-based AI shortcuts and recommendations.
What do you think overall? The question is the same as before.

Speaker 2 00:28:37
Compared with general-purpose AI, the difference is that you read the user's location and infer their intent, then provide shortcut buttons.
It has value. But as I mentioned, it infers intent from location, and being at a location does not necessarily mean the user wants to do something there. For example, if I am in a toilet, what would it recommend?
It would certainly be useful in some situations. But the location-based judgement does not mean the user necessarily wants to carry out the main activity associated with that place. I think that causal relationship needs further discussion.

Speaker 1 00:29:41
Okay, let me take notes. Next, looking at this screen again, what do you think of the overall design? [Final fragment unclear.]

Speaker 3 00:30:01
As for the interface design—

Speaker 2 00:30:03
It feels a little too full. Ideally, you want users to click one of the four instant options, since that is the fastest route.
But those four options take up about 50% of the chat area. A user may simply want to type something else, and that could create some visual pressure.
Also, the UI does not seem entirely consistent with the earlier screens, particularly the rounded corners. Those are my main points.

Speaker 1 00:31:09
Okay, go back. There are no detailed screens for the next features, so I will describe them. First is Translate Signs: take a photo to translate signs and similar things.

Second is Free Tram Checker. Melbourne has a free zone where, as described here, you can travel on public transport for free. It would tell you in real time whether you are inside that zone.
Third is Healthcare Support Contacts, recommending nearby GPs and hospitals.
Finally, Recent Scans shows your scanning history.
Considering all these features together, their interface and how you would use them, would they help you, especially as someone newly arrived in Melbourne?

Speaker 2 00:32:13
Yes, I think they would, since they are commonly used tools.

Speaker 1 00:32:26
What about the interface design? Apart from the specific Ask This Place screen you commented on, what do you think of the main screen?

Speaker 2 00:32:38
The main screen—

Speaker 3 00:32:39
I would feel that—

Speaker 2 00:32:52
It feels too packed, and its categories are not clear enough. Home and Explore are essentially a map, so there is not much to say about that.
Simulate is perhaps a guidebook with some AI simulation, and Tools contains small tools. But the overall structure and logic of the Tools page are not consistent enough.
For example, it begins with AR, then Ask This Place. Perhaps these could sit within broader categories—not necessarily just those two categories—and related tools could be grouped under them. That would make things easier to find.

Speaker 1 00:33:43
Do you mean AR and Ask This Place should form one category rather than exist as separate major features?

Speaker 2 00:33:50
Not necessarily those exact two categories. I mean all the tools could be categorised. You already categorise Simulate into Healthcare and Transport. Tools could similarly group features by function. I think that would make them easier to find.

Speaker 1 00:34:15
So it needs more categorisation according to functional characteristics?

Speaker 2 00:34:19
Yes. The structure needs logical connections.

Speaker 1 00:34:28
What makes the logic feel disconnected? Is it the arrangement of the interface?

Speaker 2 00:34:34

Yes, the arrangement. Currently, you can only look down a vertical list when interacting with it. Like Simulate, you could have grouping buttons at the top and display the categories separately.

Speaker 1 00:34:49
Understood. Let us finish with a few overall questions. Of the features just shown, which would be most useful if you were a student newly arrived in Melbourne?

Speaker 2 00:35:20
Probably two: Simulate, with AI simulation of common everyday scenarios, and AR Lens, because unfamiliar small machines, tools, and objects overseas can be difficult to understand. That would be convenient.

Speaker 1 00:35:45
Which feature would you be unlikely to use, or consider less meaningful?

Speaker 2 00:35:53
The map, particularly the map levelling feature. When I studied overseas, I visited new places, but I could mark them in Google Maps and go there. That was already clear. I could also categorise and save places worth visiting in each city myself.
Here, you seem to be using experience and levels to encourage use. In practice, I do not think that would have much effect unless you added a social element, which might make it more useful.

Speaker 1 00:36:40
If we changed only one feature in the next version, what should we prioritise?

Speaker 2 00:36:47
I would lean towards turning all the non-map functionality into one AI.
For example, Simulate could be entirely AI. In Tools, Ask This Place is already a chatbot, and using AR Lens is similar to taking a photo with AI. I would tend to combine those into one main AR feature.

Speaker 1 00:37:26
Okay, that concludes today's interview. Thank you very much for taking the time. I will send you the form afterwards; please sign it.

Speaker 2 00:37:40
Okay.

P6 — English Translation

Speaker 1 00:00:00
The test will take about thirty to thirty-five minutes. It will include a background interview, a prototype demonstration, some simple interactions, and open-ended follow-up questions.
First, I need to clarify that Day One is an app concept designed to help people newly arrived in Melbourne become familiar with local life. Today we will show features such as short trips and a

Journey feature that presents a learning process. Since I have not completed all of it, we will only show the healthcare learning process.
We will also show two tools for assistance on site. It is not a complete app yet. There is no backend, only some clickable frontend interactions, so we may need to switch screens manually or explain some parts.
The main purpose is to find out whether you understand the screens and whether these features help you.
We are testing our design, rather than your abilities. Please point out anything unclear, unnecessary, or different from what you expected.
Let us begin with background questions. Are you an undergraduate or postgraduate student?
Postgraduate, okay. How long have you been in Melbourne, and how familiar are you with everyday life here?

Speaker 2 00:01:12
How long? Five years—almost five years. I am fairly familiar with life here.

Speaker 1 00:01:17
Could you think back to when you first arrived? What was the first unfamiliar everyday process you encountered, and how did you deal with it?

Speaker 2 00:01:26
When I first arrived, I think I searched Xiaohongshu for guides and also looked online. Mainly, I read how other people had done the same thing on Xiaohongshu.
I learned from their process and worked out what I needed to do next. I would become familiar with the process first, then do it.

Speaker 1 00:02:05
Have you found a GP or booked a medical appointment in Australia?

Speaker 2 00:02:10
Yes, I have seen a GP, but online. I have not been in person.

Speaker 1 00:02:15
How did you learn about that process?

Speaker 2 00:02:18
The same way. I first looked on Xiaohongshu for how to find a GP in Melbourne and which app to use. After reading their recommendations, I downloaded the app and followed its process to—

Speaker 1 00:02:38
Complete the consultation. Understood. Let us begin testing the features. First, I should explain that this feature does not have a complete working process, so I may need to guide you between screens. We are mainly testing clarity of the interface and whether the feature is useful.
Here is the first scenario: imagine you have just arrived in Melbourne and are going to the University of Melbourne. You are not in a particular hurry today and want to get to know nearby places along the way. Let us see how the interface can help.
This is the first screen. If you wanted to plan an outing, where would you tap?

Speaker 3 00:03:18
I want to plan an outing.

Speaker 2 00:03:20
The screen does not seem complete. It looks cropped or scaled down because I am using the web version. How can I—do you have the Figma app? I have the app, but why does the link open—

Speaker 4 00:03:31
Tap the copied link, then the top-right corner.

Speaker 1 00:03:34
Opening it in the browser is okay. Returning to the question: if you wanted to start a journey, where would you tap?

Speaker 5 00:03:48
Where.

Speaker 2 00:03:49
The main screen is a map, with nearby landmarks or places marked on it. At the bottom, I can see Plan Trip. If my aim were to plan a trip or a short outing, I would probably tap Start here.

Speaker 1 00:04:22
To start planning, okay. On this screen, please look first without my explaining it. Can you understand what it does? You can also comment on whether the overall design is clear.

Speaker 2 00:04:39
First, it asks me to set a destination. I would search and choose one. Then I see a map, which may provide navigation or other options showing how to get there.
There is an option to Generate Discovery Route. It shows checkpoints and experience points, perhaps points that will be saved in my account later.
It says Campus Navigator, so I can use it to— I do not yet know what the experience points do, but it can give me a Campus Navigator badge.
I can also see other suggestions, probably nearby landmarks where I can earn experience.
I would choose the University of Melbourne, because that is where I said I wanted to go.

Speaker 6 00:06:02
So I would generate a Discovery Route.

Speaker 1 00:06:06
Okay, the question for this screen is the same: can you understand what it does? Okay, I can see that it has planned a— [The next speaker continues the thought.]

Speaker 2 00:06:15
Route. But it does not look like a direct route to the destination; there are checkpoints, as it mentioned earlier. I would try to understand what those checkpoints mean—perhaps I am meant to discover these places.

It says “A smarter way to campus,” tells me how long it takes and which places I will pass, and provides basic introductions and information about them. I accumulate experience at each place, perhaps up to 250 in total.
This screen tells me which places are on the route. I would like to choose my checkpoints: perhaps I do not want to visit some places or would prefer others. Can I make personalised choices?
For example, there might be ten checkpoints along the route, and I want to reach the University of Melbourne in twenty or thirty minutes. The app could tell me that I can visit at most two or three within that time, and I could choose which two or three.
That would provide some personalisation. Once I had chosen my checkpoints, I would tap Start Journey.

Speaker 1 00:07:56
Let me explain this screen. It represents what you would see while actually travelling along the route. It has no animation, only a display screen. The question is the same: can you understand the feature?

Speaker 2 00:08:11
It is a navigation layout. It tells me where my next checkpoint is and which checkpoint I came from. There are tips and progress bars showing the checkpoints I have passed. It also displays information about the place below. Can I drag this up? No. There are some basic information prompts. Okay, View Details.
Nothing happens here, but I assume I should be able to view details. I can also Pause, which means pausing the journey.
I think I understand. It is navigation, and I can learn about the place while I am on my way there.

Speaker 1 00:09:10
Information about it, yes. Please go to the next screen. This is the final one.

Speaker 2 00:09:17
On the final screen, I have arrived at my destination. I can see that I earned the Campus Navigator badge and experience points. It tells me about my journey: how long I walked, how far, and which places I passed.
It also gives recommendations—

Speaker 7 00:09:46
Nearby ones. Okay.

Speaker 2 00:09:49
I can choose to continue exploring the campus.

Speaker 1 00:09:56
Now we are back on the home screen. That is the complete process. First, how did the overall process feel? Were there any—

Speaker 8 00:10:08
Some—

Speaker 1 00:10:10
Unclear parts or anything you did not understand?

Speaker 2 00:10:15
There was nothing I particularly failed to understand. I think the whole process is clear: planning where to go, choosing intermediate stops, navigating, and reading the information provided below. Overall, it would help me explore a new setting and learn more about the surrounding area along the way.
What I might add is more choice of [option unclear in source]. For example, within a fixed time or distance, it could offer more options so I can choose what I prefer. It could also show recommendation levels or—

Speaker 9 00:11:18
For example, how many people have—

Speaker 2 00:11:22
Visited these places, or recommendations from other people. I could customise my whole journey.

Speaker 1 00:11:32
We have had feedback suggesting community features, such as comments and recommendations at each checkpoint [additional wording unclear]. Would that help?

Speaker 2 00:11:54
It might. Comments could also have negative effects: unfavourable comments might influence your judgement about whether to explore somewhere.
Of course, good comments could help newcomers understand a place. For cafés or restaurants, they could suggest good options.
Newcomers could learn which restaurants or cafés around campus are worth visiting. Comments could also help them settle in by showing what to order, or—

Speaker 1 00:12:55
Okay, let us move to the next screen. Tap Simulate. Let me briefly introduce it. It is like a journey with detailed guidance at each step.
This feature is relatively complete, so I will ask questions after you go through the whole process. Please tap Choose Care to begin.

Speaker 2 00:13:24
Why is this feature called Simulate?

Speaker 1 00:13:29
Because it simulates each stage of seeking medical care.

Speaker 2 00:13:35
Okay. Healthcare is selected, so I want to plan the process of finding a doctor in advance. I can see it first asks me to choose a care type. I would tap it to see what step one involves.

Speaker 10 00:14:01
I notice that step one—

Speaker 2 00:14:03

Starts with explanations through video and text—

Speaker 9 00:14:08
Telling me what to do.

Speaker 2 00:14:11
It explains different care types in more detail, such as Emergency, Urgent Care, or GP.

Speaker 1 00:14:22
Choosing one of the three determines the subsequent branch, but we have only built the first, so choose GP. If you are unsure, there is additional information and—

Speaker 2 00:14:35
A number to call? Okay. After selecting, this “What to Do” is the same as before.

Speaker 1 00:14:42
The two videos would be different; we have just used the same image for both here.

Speaker 2 00:14:49
Then it explains how to find a GP, through university services, insurance, or online booking, and how those options differ.
It gives advance information that may influence my choice. Next, I see booking options and what to know before booking, such as consultation length, types of consultation, and how to cancel.
Then it tells me what to bring to see the GP. Next, this step—“What to Do” means what to do at this stage.
Can I go back to earlier steps? Yes. One thing is unclear to me: every “What to Do” looks the same, so I initially think they contain similar information. But actually, each tells you what to do at a different step.

Speaker 1 00:16:43
And the video provides guidance for this step, right? Yes, for the current step. [Exchange recorded under one speaker in the source.]

Speaker 2 00:16:50
Okay. The overall sequence is clear: choosing the type of healthcare, booking, preparing documents, explaining symptoms to the GP, and paying.
For someone with no experience of this, it would be very helpful.

Speaker 11 00:17:33
[Unintelligible speech in source.]

Speaker 1 00:17:58
Let me explain this part, since it is a simulated scenario and not actually implemented. It gives you a scenario as a small test of what you learned, or to help you become familiar with it.
For example, what happens if you go directly to a clinic without an appointment? How should you respond in English? You tap the button and speak in English, and it gives you [response incomplete in source]. That is roughly it.

Okay, so after Continue, it goes straight here? Yes, after Continue, this is a way to practise or test what came before. [Exchange recorded under one speaker in the source.]

Speaker 2 00:18:33
Could you add a choice rather than going straight here? For example, I might not need this. Some people might need it, while—

Speaker 11 00:18:45
Some might not.

Speaker 2 00:18:57
“Do you have...?” What do you think? Usually, messages I send myself appear on the right.

Speaker 12 00:19:08
Is that reasonable?

Speaker 1 00:19:13
Usually this—

Speaker 2 00:19:14
The other person's messages appear on the left.

Speaker 13 00:19:22
It is—

Speaker 1 00:19:27
Yes, it helps you prepare your English, a kind of English practice so you know what to say in that scenario. This example is healthcare, but there could be more scenarios. In the driving licence process, for example, it could help you know how to ask someone for information.
That is a future idea. Does that make sense? Should I go back? Yes, go back. [Brief exchange recorded under one speaker.]
Okay, that is the whole process. As before, how did it feel overall? What needs improvement? Is the amount of text sufficient, or perhaps too much?

Speaker 2 00:20:14
The process is clear. Why are these two the same? [Brief exchange and phrase unclear in source.] From the selection stage to the end, it is quite clear and can familiarise users with the process beforehand.
It would be particularly useful for someone who likes to plan. There is a lot of text, but that is understandable because there really is that much information.
If the video could cover all the text below, perhaps through animation, users would have an option that does not require reading. Watching might be quicker, since many people may not have the patience to read everything. By the last few steps, the cognitive workload could be high.
Video or audio might help. Other language options might also make it easier [part of phrase unclear in source]. Providing translation, or presenting the information in other languages from the outset, would make it easier to read.

Speaker 1 00:22:02

Previous participants have also suggested adding links within steps. For example, in the GP step, Health Services could link directly to an external website. Would that help you?

Speaker 2 00:22:27
If I am working through the process and a link suddenly takes me away, I would feel interrupted—or rather, when I return, I might not know where to continue.
Perhaps there could be an overview showing the process and the links relevant to each step, available at the end, or a few recommended links after finishing.
If a link in the middle takes me to another webpage or app, I wonder whether it would affect the experience. For me, it would have some impact.

Speaker 1 00:23:29
Another suggestion from users is to put the final scenario test on this overview screen, with a shortcut so you can access it whenever you want. Would that be more convenient?

Speaker 2 00:23:52
If I do not yet know the process and go directly into the scenario, I would not know what to do. I think it is better to have it after completing the guide.
Alternatively, once you have completed it, the shortcut could appear here. When you return, you have already finished the earlier steps and can go straight to the scenario.
If I have not completed it, I would still want to understand the whole process first.

Speaker 1 00:24:24
Then practise afterwards. On the amount of text, other participants have also raised this, and we have considered solutions. One is to collapse text rather than remove it, giving each box a quick keyword or heading that can be expanded when users want to read carefully.
Would that be better?

Speaker 2 00:24:57
Perhaps, but I think most people might not expand it. They may feel they have already seen enough.
Important information should probably remain visible. Supplementary or less important information could be collapsed.
At least collapsing it would make it look less extensive and reduce the need to keep scrolling.
Visually, it could be better.

Speaker 1 00:25:32
Okay, that concludes this feature. Let us move to the final one. [Brief exchange about the prototype not changing and finding issues is unclear in source.]
Tools is not fully completed because it needs backend functionality. Since we do not have that, I can only explain the intended functions, and you will need to imagine the usage scenarios.
First, looking at the whole screen, can you understand each feature?

Speaker 2 00:26:15
Tools. Let me see. AR Lens. If I read the explanation below, I can understand it.

Speaker 7 00:26:31
“Inside... AI... ask... what do you have?” [Fragmentary English speech in source.]

Speaker 2 00:26:44
Translate, Free Zone Check—I think I can understand them all.

Speaker 1 00:26:53
Okay, so the descriptions below make them understandable. Please open the first AR recognition feature. I will explain it briefly. It is like a camera: when you capture transport facilities or other infrastructure—for example, a myki reader or top-up machine—it gives an explanation.
You can tap Details for more information. Would this feature be useful overall? What do you think of the design? “I think it is very useful.” [Response included in the same source turn.]

Speaker 2 00:27:32
Especially for transport. Parking, for example: newcomers will not know what parking signs mean. They are difficult for non-locals or people unfamiliar with the area: how many hours you can park, and during which times parking is allowed or prohibited.
If scanning provides a clear explanation, that would be useful.
The myki explanations would also be valuable for first-time users: how to use it and features you might only learn after living here for some time.
I think it is useful and quick. Normally, if I see something unfamiliar, I might photograph it and send it to AI or do an image search, perhaps on Xiaohongshu or a search engine, because some things are hard to describe.
If this can return results simply by scanning, it would be useful. What is this “Translate”?

Speaker 1 00:29:25
Yes, that is another feature, not implemented yet, shown below. “Okay, I think this is quite good.” [Brief response recorded in the same turn.]
We also have a question about scanning. With our current design, you hold the phone to scan and get Details. Would you prefer taking a photo and receiving information directly, or continuing to hold the camera on the object while the information appears?

Speaker 2 00:29:57
Perhaps taking a photo would be better. Scanning is also fine: a box could appear like this, and after taking the photo, the information could cover the screen.
In other words, taking the photo would expand the content. Holding the camera up continuously to scan feels a little strange, as though I am recording other people.
But both options could be available; it does not have to be just one. I could scan and tap Details, or take a photo and have the content appear directly.

Speaker 1 00:30:35
Both are okay. Now let us move to the next feature, Ask This Place. Open it first. Before I explain it, can you understand what it does?

Speaker 2 00:30:49
Which one? [Interface word unclear.] “What do you need help...?” It seems to use my location to know where I am, right?
Then it offers quick support for activities at this place or things I might not know.
For example, I could tap one of these to ask, or use FAQs to ask common questions. Then it might give me—

Speaker 1 00:31:34
Answers, yes. It connects to an AI system and makes real-time recommendations based on your location. The shortcuts let you ask directly without typing.
This example is a clinic. Another example is Queen Victoria Market, where it could offer shortcuts about the most highly recommended shops online, where to [activity unclear in source], or how to talk to people.
Because it connects to AI, the questions and answers are fairly flexible, rather than consisting only of fixed—

Speaker 2 00:32:22
Posts and so on. Can I choose the place myself?

Speaker 1 00:32:32
No, it is strictly based on your actual location. But if the location detection—

Speaker 2 00:32:37
If there are many places nearby and it selects another one, can I not change it? That depends on location accuracy.
If two places are very close, such as a GP and another service in the same building, I might actually want the other place. I would need to be able to change the address or location.
Still, I think it is useful: it can quickly identify where you are and let you obtain—

Speaker 1 00:33:25
Feedback or answers to questions. Looking at the information structure, does this page give you too much information? Does it feel a little overwhelming? I mean this section specifically.

Speaker 2 00:33:43
Perhaps a little, especially this middle section. It does not look like a typical [word unclear in source], because it is quite full.
When I tap this, does it go to another page, or does it send a message as though I had typed it?

Speaker 1 00:34:11
Yes, it sends a text-like message. It is the same for this one; tapping sends a message.

Speaker 2 00:34:20
Then it looks like too much. If tapping just sends a normal message, these could perhaps be presented as quick questions or a list, making it look more like a chat.
As it is, I assume tapping them will open another page.

Speaker 1 00:34:50
Okay, now the last part. That is all the main functionality; I will just introduce what is below. Quick Tools includes things you have mostly already seen.
This is the history of things you have scanned. There is Translate Signs, a zone checker to confirm whether you are inside the zone, and Health Support to help find nearby healthcare.
Taking the previous features, this screen, and the smaller tools together, what is your overall view? Would they be useful, and would you use them often?

Speaker 2 00:35:37

As a newly arrived international student, Translate Signs would be useful. It need not be limited to signs. A useful scenario would be going to a chemist or supermarket and wanting to understand a product's ingredients or name.
Even now, I often need to look those things up, either by taking a photo or typing. A quick real-time translation would help.
Free Zone Check would also help, because newcomers genuinely do not know the zone boundaries. Is that also based on your—

Speaker 1 00:36:30
Location, yes. It depends on location accuracy, which we cannot adjust. For a fairly large area like this, it should be more manageable.
“What is Health Contact? Does it directly call an emergency number?” No, it does not simply call an emergency number. It provides information about nearby healthcare [final fragment unclear]. [Question and answer appear in one source turn.]

Speaker 2 00:36:53
In terms of practical use, all of them could be needed. This one might be less frequent, although it could still be used. As for the others, I think Scan might be used quite often.

Speaker 1 00:37:18
We previously received a suggestion that there are too many steps to get into AR. Did you feel that? “Too many?” Yes, going to Tools and then opening it. Some people felt a frequently used feature would be better on the home screen. [Brief exchange recorded under one speaker.]

Speaker 2 00:37:43
Is your home page a map, or is Home the same as Explore? “Yes.” Then what is Home currently? Is it a set of shortcuts? [Brief response included in this turn.]

Speaker 1 00:37:54
Shortcuts, but we forgot that part during testing, so later—

Speaker 2 00:37:58
Perhaps that would cover some of it. But looking beyond Home—there seems to be plenty of space. If it contains shortcuts, is there not another row below?
“Yes.” If these are all shortcuts, Tools could go below as well; otherwise, it looks a little empty. “That is true.” There are a few ways to approach it. [Some final wording unclear in source; brief exchanges included in this turn.]

Speaker 1 00:38:20
Okay, there is not much else. Finally, I have three short questions. Of all the features and screens shown, if you imagine being newly arrived in Melbourne, which best meets your needs?

Speaker 2 00:38:36
Best meets my needs—

Speaker 1 00:38:40
Think of priorities: which would you want to use first?

Speaker 2 00:38:46
Probably Simulate and Translate. Assuming I have just arrived and my English is not especially good, I would want Simulate in my mother tongue so I can understand more clearly.
Translation and Scan would also be used quite often. With Explore, when I first arrive, I might prefer to go directly where I need to go. After I have been here a while and want to explore my surroundings, I might use it.
Perhaps I would want to do something around the city [final phrase unclear in source].

Speaker 1 00:39:35
So Explore is more for when you already know how to get to university and other main destinations, and then one day you have free time and want to explore?

Speaker 2 00:39:51
Yes, when I have more time. I could set my own time limit, such as reaching university within an hour. It could tell me which places are along the way, and I could choose a few that interest me. That would be a very good experience.
I would want to use a tool that shows nearby places on my route, lets me select the ones I want to visit, and still gets me to the destination within my time limit.
It could also be useful immediately after arrival, depending on the person. Some people want to familiarise themselves with the neighbourhood straight away and might use it sooner.

Speaker 1 00:40:33
Okay. You have effectively answered the second question, about which features you might not use, so I will not repeat it. Third, if we changed only one thing in the next version, what should be the highest priority?

Speaker 2 00:40:48
Personalisation. For example, on the home page, users could choose their frequently used tools and arrange the shortcuts themselves.
For Trip, they could choose routes. For Simulate, they could choose the language. In Tools scanning, they could choose whether to take a photo or scan continuously. Add more options.
Perhaps that is hard to achieve in the prototype, but that is the general idea. Everything else seems good.

Speaker 1 00:41:44
Finally, did you ever encounter so much text that you felt completely—

Speaker 2 00:41:54
Not really. The amount of text seems okay. Simulate has a little more, but the other sections barely have much text.
Where else is there a lot? It seems fine to me. It might feel like more if you were reading for a long time, but it is still within an acceptable range.

Speaker 1 00:42:23
Okay, perhaps this layout is a little [word unclear in source], but the rest is fine. That brings us to the end. Thank you for participating.
We will send you something to sign [closing exchange about signing on a computer is unclear in source].
